Selecting a site for industrial development requires not only careful research and planning but extensive analysis and investigation. This book sets out to encourage those involved in this process to deal with the problems arising when selecting sites for commercial, industrial and civil engineering projects. Much of the land currently available for development, particularly in inner city areas, is neglected and there is considerable potential for the use of old industrial regions, derelict areas, inner city areas, contaminated land sites in addition to the existing enterprise zones. However, before embarking on a development project considerable investigation is required to assess the suitability of the site, the extent of the costs that may be incurred and in checking any legal or planning restrictions.

The new edition of Garber and Hoel's best-selling TRAFFIC AND HIGHWAY ENGINEERING focuses on giving students insight into all facets of traffic and highway engineering. Students generally come to this course with little knowledge or understanding of the importance of transportation, much less of the extensive career opportunities within the field. Transportation is an extremely broad field, and courses must either cover all transportation modes or focus on specifics. While many topics can be covered with a survey approach, this often lacks sufficient depth and students leave the course without a full understanding of any of the fields. This text focuses exclusively on traffic and highway engineering beginning with a discussion of the pivotal role transportation plays in our society, including employment opportunities, historical impact, and the impact of transportation on our daily lives. This approach gives students a sense of what the field is about as well as an opportunity to consider some of its challenges. Later chapters focus on specific issues facing transportation engineers. The text uses pedagogical tools such as worked problems, diagrams and tables, reference material, and realistic examples to demonstrate how the material is applied. E-learning encompasses many things to many people. Elliot Massie, a leading e-learning guru, states that "Online learning is not about taking a course and putting it on desktop. It encompasses "Combination of learning services and technology to provide high value integrated learning anytime and anywhere". GOLE<sup>a</sup> aims to create a virtual learning simulator that is capable of customizing the pedagogy to the learners learning style. To properly design learn by doing scenarios, the learning environment must balance the learning objectives with authenticity. The key is to build a realistic environment which is complex enough to promote expectation failure and robust enough to support the learner at that point. Two of the major learning objectives for a goal oriented learning environment are the application of facts and building specific skills. The purpose of this research was to design, develop, implement and assess a Goal Oriented Learning Environment (GOLE) into the Civil and Environmental Engineering curriculum at Lehigh University. Also to design, develop, implement, and assess Internet-based instructional systems into the CEE curriculum. To achieve these objectives, a GOLE was implemented into two courses that were used as case studies in this research. These case studies describe the instructional design method utilized and the assessment involved to evaluate the courses. The instructional design method utilized nine steps: Discuss, Determine, Decide, Design, Develop, Implement, Assessment, Evaluation and Evolve. The designing of GOLE focused on: content, delivery platform, character development and story line. In order to assess and evaluate the GOLE, a series of five evaluations were created in order to perform the analysis: skill matrix, course, performance, website evaluations and the DISC profile. The data was then analyzed to determine what parts of the course were effective.

The world's fresh water supplies are dwindling rapidly—even wastewater is now considered an asset. By 2025, most of the world's population will be facing serious water stresses and shortages. Aquananotechnology: Global Prospects breaks new ground with its informative and innovative introduction of the application of nanotechnology to the remediation of contaminated water for drinking and industrial use. It provides a comprehensive overview, from a global perspective, of the latest research and developments in the use of nanotechnology for water purification and desalination methods. The book also covers approaches to remediation such as high surface area nanoscale media for adsorption of toxic species, UV treatment of pathogens, and regeneration of saturated media with applications in municipal water supplies, produced water from fracking, ballast water, and more. It also discusses membranes, desalination, sensing, engineered polymers, magnetic nanomaterials, electrospun nanofibers, photocatalysis, endocrine disruptors, and Al<sub>3</sub> clusters. It explores physics-based phenomena such as subcritical water and cavitation-induced sonoluminescence, and fog harvesting. With contributions from experts in developed and developing countries, including those with severe contamination, such as China, India, and Pakistan, the book's content spans a wide range of the subject areas that fall under the aquananotechnology banner, either squarely or tangentially. The book strongly emphasizes sorption media, with broad application to a myriad of contaminants—both geogenic and anthropogenic—keeping in mind that it is not enough for water to be potable, it must also be palatable.
