This book presents the papers from the Internal Combustion Engines: Performance, fuel economy and emissions held in London, UK. This popular international conference from the Institution of Mechanical Engineers provides a forum for IC engine experts looking closely at developments for personal transport applications, though many of the drivers of change apply to light and heavy duty, on and off highway, transport and other sectors. These are exciting times to be working in the IC engine field. With the move towards downsizing, advances in FIE and alternative fuels,

new engine architectures and the introduction of Euro 6 in 2014, there are plenty of challenges. The aim remains to reduce both CO2 emissions and the dependence on oil-derivate fossil fuels whilst meeting the future, more stringent constraints on gaseous and particulate material emissions as set by EU, North American and Japanese regulations. How will technology developments enhance performance and shape the next generation of designs? The book introduces compression and internal combustion engines' applications, followed by chapters on the challenges faced by alternative fuels and fuel delivery. The remaining chapters explore current improvements in combustion, pollution prevention strategies and data comparisons. presents the latest requirements and

challenges for personal transport applications gives an insight into the technical advances and research going on in the IC Engines field provides the latest developments in compression and spark ignition engines for light and heavy-duty applications, automotive and other markets

Moral and political questions are vitally relevant to the issue of survival in the nuclear age. Ethics has much to teach us about the meaning of national defence and civic responsibility in the nuclear state. For instance, those in NATO who argue for increased spending on such weapons do so with the intention of defending the values of the West. They must therefore be absolutely sure that they are not – as the contributors to this volume, originally published in 1984, powerfully suggest – undermining or destroying those values by the very means they adopt to preserve them. With the continued success of nuclear deterrence itself in question, responsible citizens feel an urgent need to assess the clash between personal doubts, cherished principles and their governments' loudly voiced moral certainties. In *Objections to Nuclear Defence*, professional philosophers of widely varying persuasions provide new analyses of these problems. They spell out clearly and vividly the moral and political objections – objections to the concrete nuclear policies of

the Western governments today. Often impassioned but always rational, the book will be of special interest to students of international affairs, peace studies and applied philosophy as well as to the general reader who is trying to choose between political parties in Europe or North America.

Porting demands the right tools, skills, and application of knowledge. Few other engine builders have the same level of knowledge and skill porting engine heads as David Vizard. All the aspects of porting stock as well as aftermarket heads in aluminum and cast-iron constructions are covered. Vizard goes into great depth and detail on porting aftermarket heads. Starting with the basic techniques up to more advanced techniques, you are shown how to port iron and aluminum heads as well as benefits of hand and CNC porting.
