Disaster risk management is essential in the fight against poverty. Disasters can, in an instant, wipe out decades of hard-fought poverty reduction and development gains and push countless households into poverty. Disasters disproportionately affect the poor: Vulnerable and marginalized groups, including women, children, the elderly, and people with disabilities, are at particular risk. East Asia and the Pacific is the most disaster-stricken region in the world, suffering from small recurrent as well as rare high-impact events. East Asia is rapidly urbanizing, and cities are becoming disaster hotspots. Unplanned or poorly planned urbanization, which puts more people and assets in harm's way, is the single largest driver of disaster risk. There is deep uncertainty about future disaster and climate risks, challenging our ability to adapt to new developments and changing the physical and natural environment. Decision makers can make a significant difference by effectively managing disaster risk and building resilience. With education and communication, preparedness, and investments, urbanization can be channeled as a tremendous positive force for development. By decreasing disaster exposure and vulnerability through systematic assessments and communication of risks, better land-use planning, and many other practical measures, the impacts of natural hazards can be reduced significantly. At the same time, it is necessary to recognize that the risks of disasters cannot be entirely eliminated, and countries need to plan for failure by considering different scenarios, especially within complex systems and networks. Preventive investments in risk reduction and emergency

preparedness can be extremely cost-effective and can greatly reduce the impact of natural hazards. Governments can prioritize actions based on informed decisions about the level of risk to reduce the risks from disasters. Public investments, such as early-warning systems, retrofitting of critical infrastructure at risk, and mainstreaming systematic risk assessments into relevant public investment planning processes, can help to reduce poverty and promote sustainable economic growth. The World Bank supports countries around the world in mainstreaming a comprehensive and integrated approach to disaster risk management into development. The World Bank provides analytical and advisory services, helps to build climate and disaster resilience into core investments across sectors, and offers unique financial solutions to better manage the contingent fiscal risks from disasters.

Political science has had trouble generating models that unify the study of the formation and consolidation of various types of states and empires. The business-administration literature, however, has long experience in observing organizations. According to a dominant model in this field, business firms generally take one of two forms: unitary (U) or multidivisional (M). The U-form organizes its various elements along the lines of administrative functions, whereas the M-form governs its periphery according to geography and territory. In *Logics of Hierarchy*, Alexander Cooley applies this model to political hierarchies across different cultures, geographical settings, and historical eras to explain a variety of seemingly disparate processes: state

formation, imperial governance, and territorial occupation. Cooley illustrates the power of this formal distinction with detailed accounts of the experiences of Central Asian republics in the Soviet and post-Soviet eras, and compares them to developments in the former Yugoslavia, the governance of modern European empires, Korea during and after Japanese occupation, and the recent U.S. occupation of Iraq. In applying this model, *Logics of Hierarchy* reveals the varying organizational ability of powerful states to promote institutional transformation in their political peripheries and the consequences of these formations in determining pathways of postimperial extrication and state-building. Its focus on the common organizational problems of hierarchical polities challenges much of the received wisdom about imperialism and postimperialism.

The calculation of partial derivatives is a fundamental need in scientific computing. Automatic differentiation (AD) can be applied straightforwardly to obtain all necessary partial derivatives (usually first and, possibly, second derivatives) regardless of a code's complexity. However, the space and time efficiency of AD can be dramatically improved—sometimes transforming a problem from intractable to highly feasible—if inherent problem structure is used to apply AD in a judicious manner. *Automatic Differentiation in MATLAB using ADMAT with Applications* discusses the efficient use of AD to solve real problems, especially multidimensional zero-finding and optimization, in the MATLAB environment. This book is concerned with the determination of the first and second derivatives in the context of solving scientific computing problems with an emphasis on optimization and solutions to nonlinear systems. The authors focus on the application rather than the

implementation of AD, solve real nonlinear problems with high performance by exploiting the problem structure in the application of AD, and provide many easy to understand applications, examples, and MATLAB templates. ö

the midst of two concurrent global trends that will gain more significance in coming years. The world is experiencing the consequences of not only rapid globalisation, but also urbanization. Unique in developing a typology of global risks that threaten a global city like Singapore, beyond its Asian focus, the book also draws out thematic and policy lessons pertinent to other global cities.

Assessing and managing risk is vitally important, and is increasingly studied in a range of areas including politics and international relations, finance and insurance, and innovation and the valuing of intangible assets such as patents and intellectual property. The degree to which innovation is encouraged or otherwise – a key factor for many businesses - depends in part on the attitude towards risk in the context in which it takes place. Taplin considers the different attitudes towards risk and innovation, and the different ways in which risk and innovation are handled, in Japan, Britain the USA. Providing a broad and detailed examination of the subject, she discusses topics including risk management standards, managing risk in marketing, the insurance industry, patents, and in venture capital, and of how risk management in organizations has evolved.
