The title of this research study is: Attitudes of grade 11 female students towards physical science in selected high schools in the Mafikeng district. Attitudinal measures, such as levels of student s interest and the perceived utility of science, were examined. The study showed that the attitudes of grade 11 female students in the selected high schools were affected by parents, teachers, peers, classroom environment, personal perception and aspiration.

Scientific literacy is part of national science education curricula worldwide. In this volume, an international group of distinguished scholars offer new ways to look at the key ideas and practices associated with promoting scientific literacy in schools and higher education. The goal is to open up the debate on scientific literacy, particularly around the tension between theoretical and practical issues related to teaching and learning science. Uniquely drawing together and examining a rich, diverse set of approaches and policy and practice exemplars, the book takes a pragmatic and inclusive perspective on curriculum reform and learning, and presents a future vision for science education research and practice by articulating a more expansive notion of scientific literacy.

Atomic Nuclei Physical Science, Grade 11 Nuclear physics is the branch of physics which deals with the nucleus of the atom. Within this field, some scientists focus their attention on looking at the particles inside the nucleus and understanding how they interact, while others classify and interpret the properties of nuclei. This detailed knowledge of the nucleus makes it possible for technological advances to be made. In this book, we touch on each of these different areas within the field of nuclear physics. Chapter Outline: Radioactivity and types of radiation Sources of radiation Half-life Dangers and uses of radiation Nuclear fission and fusion The Open Courses Library introduces you to the best Open Source Courses.

Electronic Properties of Matter

Electronic Properties of Matter Physical Science, Grade 11 We can study many different features of solids. Just a few of the things we could study are how hard or soft they are, what their magnetic properties are or how well they conduct heat. The thing that we are interested in, in

this book, are their electronic properties. Simply, how well do they conduct electricity and how do they do it. Chapter Outline: Conductors, insulators and semi-conductors Intrinsic properties and doping The p-n junction The Open Courses Library introduces you to the best Open Source Courses.

Electromagnetism Physical Science, Grade 11

Electromagnetism describes between charges, currents and the electric and magnetic fields which they give rise to. An electric current creates a magnetic field and a changing magnetic field will create a flow of charge. This relationship between electricity and magnetism has resulted in the invention of many devices which are useful to humans. Chapter Outline: Magnetic field associated with a current Current induced by a changing magnetic field Transformers Motion of a charged particle in a magnetic field The Open Courses Library introduces you to the best Open Source Courses.

Electric Circuits Physical Science, Grade 11 Ohm's Law tells us that if a conductor is at a constant temperature, the current flowing through the conductor is proportional to the voltage across it. In a light bulb, the resistance of the filament wire will increase dramatically as it warms from room temperature to operating temperature. If we increase the supply voltage in a real lamp circuit, the

resulting increase in current causes the filament to increase in temperature, which increases its resistance. This effectively limits the increase in current. In this case, voltage and current do not obey Ohm's Law. Chapter Outline: Ohm's Law Resistance Parallel and series networks The Open Courses Library introduces you to the best Open Source Courses.

Electrostatics Physical Science, Grade 11 The electrostatic force was first studied in detail by Charles Coulomb around 1784. Through his observations he was able to show that the electrostatic force between two point-like charges is inversely proportional to the square of the distance between the objects. He also discovered that the force is proportional to the product of the charges on the two objects.
