Three nations in similar economic situations since the 1970s have pursued different monetary strategies. Walsh argues that monetary policies produce predictable winners and losers, and that policy choice is a function of how industrial firms,

banks and unions use their political resources.

The whole landscape of space use is undergoing a radical transformation. In the workplace a period of unprecedented change has created a mix of responses with one overriding outcome observable worldwide: the rise of distributed space. In the learning environment the social, political, economic and technological changes responsible for this shift have been further compounded by constantly

developing theories of learning and teaching, and a wide acceptance of the importance of learning as the core of the community, resulting in the blending of all aspects of learning into one seamless experience. This book attempts to look at all the forces driving the provision and pedagogic performance of the many spaces, real and virtual, that now accommodate the experience of learning and provide pointers towards the creation and design of learning-centred communities. Part 1 looks at the entire learning universe as it now stands, tracks the way in which its

constituent parts came to occupy their role, assesses how they have responded to a complex of drivers and gauges their success in dealing with renewed pressures to perform. It shows that what is required is innovation within the spaces and integration between them. Part 2 finds many examples of innovation in evidence across the world - in schools, the higher and further education campus and in business and cultural spaces - but an almost total absence of integration. Part 3 offers a model that redefines the learning landscape in terms of learning

outcomes, mapping spatial requirements and activities into a detailed mechanism that will achieve the best outcome at the most appropriate scale. By encouraging stakeholders to creating an events-based rather than space-based identity, the book hopes to point the way to a fully-integrated learning landscape: a learning community.

The City Record

Here is the first historical and sociological account of the formation of an interdisciplinary science known as genetic toxicology, and of the scientists' social movement that

created it. After research geneticists discovered that synthetic chemicals were capable of changing the genetic structure of living organisms, scientists began to explore how these chemicals affected gene structure and function. In the late 1960s, a small group of biologists became concerned that chemical mutagens represented a serious and possibly global environmental threat. Genetic toxicology is nurtured as much by public culture as by professional practices, reflecting the interplay of genetics research and environmental politics. Drawing on a wealth of resources, Scott Frickel examines the creation of this field through the lens of social movement theory. He reveals how a committed group of scientist-activists transformed chemical mutagens into environmental problems, mobilized existing research networks, recruited scientists and politicians, secured financial resources, and developed new ways of acquiring knowledge. The result is a book that vividly illustrates how science and activism were interwoven to create a discipline that remains a defining feature of environmental health science.

International trade policy is facing a cross-roads. This is

creating uncertainty, impairing world economic growth.

Unless a policy of more open markets is pursued, protectionism may well turn into a self-perpetuating and cumulative process. This is why the 1986 Kiel Conference was devoted to Free Trade in the World Economy:

Towards an Opening of Markets. We felt that such a conference would help to stimulate policy discussion preceding the Uruguay Round under the auspices of the GATT and the moves within the European Community towards completing a common internal market by 1992.
