The discipline of graph theory is a broad one, and no textbook could possibly cover all of

it, but Graphs and Digraphs gets as close to it as you are likely to find in a single book. The proofs and theorems are stated and proved quickly, giving brief examples only when it feels they are needed.

Abstract. Throughout the chapter we introduce important concepts as well as basic results: given an integral quadratic form  $q: \mathbb{Z}^n \rightarrow \mathbb{Z}$ , numbers of the form  $q(v)$  for a vector  $v$  in  $(\mathbb{Z}^n)$  are said to be represented by  $q$ , and the form  $q$  is said to be universal if every positive integer is represented by  $q$ . We sketch the proof of Conway and Schneeberger's ...
