Adolescenceâ€"begin

critical period of

adolescence as a

CHILDHOOD AND GROWING UP National

Academies Press
Physical inactivity is a key determinant of health across the lifespan. A lack of activity increases the risk of heart disease, colon and breast cancer, diabetes mellitus, hypertension, osteoporosis, anxiety and depression and others diseases. Emerging literature has suggested

that in terms of mortality, the global population health burden of physical inactivity approaches that of cigarette smoking. The prevalence and substantial disease risk associated with physical inactivity has been described as a pandemic. The prevalence, health impact, and evidence of changeability all have resulted in calls for action to increase physical activity across the lifespan. In response to the need to find ways to make physical activity a health priority for youth, the Institute of Medicine's Committee on Physical Activity and Physical Education in the School Environment was formed. Its purpose was to review the current status of physical activity and physical education in the school environment, including before, during, and after school, and examine the influences of physical activity and physical education on the

short and long term physical, cognitive and brain, and psychosocial health and development of children and adolescents. Educating the Student Body makes recommendations about approaches for strengthening and improving programs and policies for physical activity and physical education in the school environment. This report lays out a set of guiding principles to guide its work on these tasks. These included: recognizing the benefits of instilling life-long physical activity habits in children; the value of using systems thinking in improving physical activity and physical education in the school environment; the recognition of current disparities in opportunities and the need to achieve equity in physical activity and physical education; the importance of considering all types of school environments; the need to

take into consideration the diversity of students as recommendations are developed. This report will be of interest to local and national policymakers, school officials, teachers, and the education community, researchers, professional organizations, and parents interested in physical activity, physical education, and health for school-aged children and adolescents.

In the past 30 years, China has achieved an unprecedented development 'miracle' in human history. How did China achieve this? What are the key drivers for such a rapid growth? And most importantly, what can be learned from China's success? While many factors could be identified to explain China's success, it is no doubt that the numerous Special Economic Zones (SEZs) and industrial clusters that emerged after the country's

reforms are two important engines that have been driving China's rapid development. The key experiences of China's SEZs and industrial clusters could be best summarized as: gradualism with experimental approach; strong commitment; and an active facilitating state with strong pragmatism. This book reviews the development experiences of China's SEZs and industrial clusters through extensive research, field visits, and case studies in an attempt to benefit the policy-makers, development practitioners, scholars from developing countries, and the global development community in general. It contains five detailed case studies three SEZs in the broadest sense (Shenzhen, Tianjin and Kunshan) and two industrial clusters (Wenzhou footwear cluster in Zhejiang and Xiqiao textile cluster in Guangdong). This volume represents the most comprehensive volume to date on China's experiences with both its SEZ and cluster

experiences.

"The scope of this volume is indicated by the subtitle. The basic data furnish an outline of the psychology of infancy, by bringing into systematic view cross-section behavior pictures of the ascending stages of development. The emphasis throughout is on the normal aspects of behavior. The application of norms of development to problems of developmental diagnosis and supervision is treated in the concluding sections. The investigation on which this book is based was begun some six years

ago and has put the writer under an increasing sense of indebtedness to many persons who have lent their assistance. The study is one which has required a considerable degree of cooperation. We have been particularly fortunate in the amount and kind of cooperation which we have received from numerous mothers--to say nothing of the several hundred children, whose contribution we hope is not altogether lost in the pages of this book. The main body of this volume is devoted to a descriptive and normative treatment of data derived from a first-hand study of normal children. This part of the study has been supplied with illustrations and is so concrete that it may,

perhaps, be of interest to the general reader, as well as to the parent or to the special worker who is directly concerned with the mental health and development of early childhood. Current tendencies in child hygiene and education are bringing the pre-school years into a new perspective. There are scientific as well as practical reasons for giving special consideration to this foundational period of childhood. Our aim in the present volume is to give a systematic view of the entire pre-school period of development. We are conscious of the preliminary character and of the limitations of our data; but we probably have not over-

emphasized the basic importance of the pre-school years of development"--Preface. (PsycINFO Database Record (c) 2006 APA, all rights reserved).
