The northeastern seaboard of Canada and the United States, extending from Labrador to Cape Cod, was the first region of North America to suffer from human exploitation. Farley Mowat informs extensive historical and biological research with his direct experience living in and observing this region. When it was first published more than 20 years ago, *Sea of Slaughter* served as a catalyst for environment reform, raising awareness of the decline and destruction of marine and coastal species. Today, it remains a prescient environmental classic, serving, now as ever, as a haunting reminder of the impact of human interest on the natural world.

Occupational Health in Developing Countries Routledge

Floods and droughts are climate extremes that account for more than 80% of people affected by natural

disasters worldwide. Both catastrophes co-exist in many river basins, for example, the Mun River Basin in Thailand, which is selected as the study area. Approximately 90% of rice cultivation here is rain-fed, and that results in the lowest yields in the country, making many farmers persist in poverty. This study aims to assess floods and droughts and their impacts on agriculture at the basin scale. For flooding, the hydrologic and hydraulic models were developed to produce the first completed flood hazard maps at the Mun River Basin. Droughts in the basin were determined by the proposed drought risk assessment scheme that combines all three key components (hazard, exposure, and vulnerability). Subsequently, the study attempts to tackle both floods and droughts simultaneously and sustainably by using integrated measures and strategies. If the problems caused by flood and drought climate extremes are solved, this will ensure adequate food availability and alleviate poverty in the basin. Furthermore, the study shows that a holistic approach to simultaneously solving both problems is efficient as most water will be utilized to benefit agriculture, the primary sector that feeds a growing population.

The Ganges is one of the most complex yet fascinating river systems in the world. The basin is characterized by a high degree of heterogeneity from climatic, hydrological, geomorphological, cultural, environmental and socio-economic perspectives. More than 500 million people are directly or indirectly dependent upon the Ganges River Basin, which spans China, Nepal, India and Bangladesh. While there are many books covering one aspect of the Ganges, ranging from hydrology to cultural significance, this book is unique in presenting a comprehensive inter-disciplinary overview of the key issues and challenges facing the region. Contributors from the three main riparian nations assess the status and trends of water resources, including the Himalayas, groundwater, pollution, floods, drought and climate change. They describe livelihood systems in the basin, and the social, economic, geopolitical and institutional constraints, including transboundary disputes, to achieving productive, sustainable and equitable water access. Management of the main water-use sectors and their inter-linkages are reviewed, as well as the sustainability and trade-offs in conservation of natural systems and resource development such as for hydropower or agriculture.

William Kennedy (1814 – 1890) was an explorer and fur trader. In 1851 he was recommended to Lady Franklin as the commander of her second sponsored expedition in search of her husband, Arctic explorer Sir John Franklin (1786 – 1847), who had not returned from his 1845 expedition to chart the remaining unexplored section of the Arctic and the Northwest Passage. This volume, first published in 1853, contains Kennedy's account of his 1851 Arctic expedition to rescue Sir John Franklin. Written in the form of a diary, Kennedy describes in detail the hazardous conditions of the Arctic. The crew's experiences including snow blindness, frostbite, scurvy and explorations of land on foot accompanied by Husky dogs are described in detail. Kennedy's use of Inuit survival methods and the type of provisions which were used are also described, providing valuable insights into early nineteenth century methods of Arctic exploration.

This is a long-overdue volume dedicated to space trajectory optimization. Interest in the subject has grown, as space missions of increasing levels of sophistication, complexity, and scientific return - hardly imaginable in the 1960s - have been designed and flown. Although the basic tools of optimization theory remain an accepted canon, there has been a revolution in the manner in which they are applied and in the development of numerical optimization. This volume purposely includes a variety of both analytical and numerical approaches to trajectory optimization. The choice of authors has been guided by the editor's intention to assemble the most expert and active researchers in the various specialities presented. The

authors were given considerable freedom to choose their subjects, and although this may yield a somewhat eclectic volume, it also yields chapters written with palpable enthusiasm and relevance to contemporary problems.

This issue discusses a number of factors affecting global growth, as well as growth prospects across the world ' s main countries and regions. It assesses the ongoing recovery from the global financial crisis in advanced and emerging market economies and evaluates risks, both upside and downside, including those associated with commodity prices, currency fluctuations, and financial market volatility. A special feature examines in detail causes and implications of the recent commodity price downturn; analytical chapters look at the effects of commodity windfalls on potential output and of exchange rate movements on trade.
