The Web is a globalinformationspace consistingoflinked documents andlinked data. As the Web continues to grow and new technologies, modes of interaction, and applications are being developed, the task of the Semantic Web is to unlock the power of information available on the Web into a common semantic inf- mation space and to make it available for sharing and processing by automated tools as well as by people. Right now, the publication of large datasets on the Web, the opening of data access interfaces, and the encoding of the semantics of the data extend the current human-centric Web. Now, the Semantic Web c- munity is tackling the challenges of how to create and manage Semantic Web content, how to make Semantic Web applications robust and scalable, and how to organize and integrate information from di?erent sources for novel uses. To foster the exchange of ideas and collaboration, the International Semantic Web Conference brings together researchers and practitioners in relevant disciplines such as arti?cial intelligence, databases, social networks, distributed computing, Web engineering, information systems, natural language processing, soft c- puting, and human – computer interaction. This volume contains the main proceedings of ISWC 2008, which we are - cited to o?er to the growing community of researchers and practitioners of the Semantic Web. We got a tremendous response to our call for research papers from a truly international community of researchers and practitioners from 41 countries submitting 261 papers. Each paper receivedan

The illicit trade in art and other cultural objects now constitutes one of the most prevalent categories of international crime. Law-enforcement agencies have long recognized that documentation is critical to the

protection and recovery of these objects. Standards were needed that would make it possible for information on stolen objects to move easily across electronic networks and, at the same time, that would be intelligible to law enforcement and art communities alike. Developed through the collaboration of museums, police and customs agencies, the art trade, the insurance industry, and appraisers of art and antiques, Object ID is an international standard that defines the minimal information needed to identify art, antiques, and antiquities. Introduction to Object ID summarizes the evolution of Object ID, explains its nine categories, and offers guidelines for using them. The book provides suggestions for writing descriptions of objects and includes a brief discussion of five additional categories that some institutions opt to employ. The second part of the book sets out guidelines for choosing viewpoints, selecting backgrounds, and positioning lighting when documenting cultural objects with photography. The Introduction to series acquaints professionals and students with the complex issues and technologies in the production, management, and dissemination of cultural heritage information resources.

Software is the essential enabler for the new economy and science. It creates new markets and new directions for a more reliable, flexible, and robust society. It empowers the exploration of our world in ever more depth. However, software often falls short behind our expectations. Current software methodologies, tools, and techniques remain expensive and not yet reliable for a highly changeable and evolutionary market. Many approaches have been proven only as case-by-case oriented methods. This book presents a number of new trends and theories in the direction in which we believe software science and engineering may develop to transform the role of software and science in tomorrow ' s information society. This publication is an attempt to capture the essence of a new state of art in software science and its supporting technology. Is also aims at identifying the challenges such a technology has to master.
