Does health promotion have a lasting and positive effect on people? With mounting pressure to reduce costs to the NHS and increasing scepticism of the so-called nanny state, health promotion initiatives are increasingly being criticised as costly and ineffective, with many arguing that health inequalities can only be reduced through radical political and economic change. This book examines the methods used to evaluate the value of health promotion

projects and determines whether attempts to change people's lifestyles have proved successful. Taking into account the practical and ethical issues involved in deciding the appropriate approach to take in efforts to reduce health inequalities, the book assesses what might be the best path forward for health promotion.

In the United States, some populations suffer from far greater disparities in health than others. Those disparities are caused not only by fundamental differences in health status across segments of the population, but also because of inequities in factors that impact health status, so-called determinants of health. Only part of an individual's health status depends on his or her behavior and choice; community-wide problems like poverty, unemployment, poor education, inadequate housing, poor public transportation, interpersonal violence, and decaying neighborhoods also contribute to health inequities, as well as the historic and ongoing interplay of structures, policies, and norms that shape lives. When these factors are not optimal in a community, it does not mean they are intractable: such inequities can be mitigated by social policies that can shape health in powerful ways. **Communities in Action: Pathways to Health Equity** seeks to delineate the causes of and the solutions to health inequities in the United States. This report focuses on what communities can do to promote health equity, what actions are needed by the many and varied stakeholders that are part of communities or support them, as well as the root causes and structural barriers that need to be overcome.

This volume is based upon a review of available literature and intervention experiences selected from modern and traditional societies. It is augmented by the lessons learned through the editors' experience in teaching courses on health communication and foundation of health behavior in graduate public health programs at several leading universities in the United States and abroad over two decades. Examples and implications are also drawn from extensive involvement in diverse health and health communication projects, such as the on-going community-based public health project in South Central Los Angeles sponsored by UCLA and the Kellogg Foundation. This particular project is designed to develop health promotion communication interventions.

In the realm of health care, privacy protections are needed to preserve patients' dignity and prevent possible harms. Ten years ago, to address these concerns as well as set guidelines for ethical health research, Congress called for a set of federal standards now known as the HIPAA Privacy Rule. In its 2009 report, *Beyond the HIPAA Privacy Rule: Enhancing Privacy, Improving Health Through Research*, the Institute of Medicine's Committee on Health Research and the Privacy of Health Information concludes that the HIPAA Privacy Rule does not protect privacy as well as it should,

and that it impedes important health research.

"Well before evidence-based practice became fashionable beyond clinical medicine, the team at SSRU was telling us what we ought to already know - that some interventions work better than others, and that that some well-meaning attempts at health promotion, just like medicine and surgery, may do harm. This book is a must for policy makers and practitioners who want to make a real difference, and understand how research evidence can inform their practice. The book will also be an important tool for researchers, who will increasingly be using the tools of systematic review if they want to inform and influence those who deliver services." - Helen Roberts, Professor of Child Health, City University
This book bridges the gap between research and practice in health promotion. It advances evidence-based health promotion by illustrating how service providers and researchers can change their working practices to benefit the public. It addresses the need for health promotion services to be grounded in empirical research, and for research to focus on issues important to those delivering as well as those receiving the services. *Using Research for Effective Health Promotion* advances the debate about the relative values of qualitative and experimental research in health promotion, and encourages an increased participation of service users in the development and evaluation of services. It provides health promotion specialists with time-saving tools to draw upon research quickly and critically; and is an important resource for students and professionals in fields such as public health, nursing, education, social work, and voluntary services.

In *Rethinking Health Promotion: A global approach*, Theodore MacDonald retraces the development of health promotion to show that, far from being a modern innovation, it has existed as a distinct and separate enterprise for as long as biomedicine. Biomedicine's dominance has obscured the fact that health is more than merely the absence of illness and that poor health is often the result of social, cultural and economic factors. The principal function of health promotion is to create conditions which promote rather than damage health by bringing about changes in international, national and local policy. *Rethinking Health Promotion* throws open the debate about the function and position of health promotion in modern societies. Undergraduate and postgraduate students of Health Studies and others studying health promotion as part of a professional training will find this book stimulating reading.

Building Health Promotion Capacity explores the professional practice of health promotion and, in particular, how individuals and organizations can become more effective in undertaking and supporting such practice. The book is based on the experiences of the Building Health Promotion Capacity Project (1998-2003), a continuing education and applied research venture affiliated with the Saskatchewan Heart Health Program. The project studied the process of capacity development in relation to practitioners and regional health districts in Saskatchewan. For health promotion practitioners across Canada and beyond, this book provides a coherent framework for effective professional practice. Leaders in health sector organizations will develop a firmer grasp of how to support health promotion practice and how to recruit and retain individual practitioners with a high level of capacity. Policy makers will improve their knowledge of environments that support the health promotion capacity of individuals and organizations. Scholars will learn about the nature of health promotion capacity and about a methodology for its study.
