An energy transfer is heat transfer when its driving force is temperature difference. 1-10C Thermal energy is the sensible and latent forms of internal energy, and it is referred to as heat in daily life. 1-11C For the constant pressure case. This is because the heat transfer to an ideal gas is  $mC_p\Delta T$  at constant pressure and  $mC_p\Delta T$  at constant volume, and  $C_p$  is always greater than  $C_v$ .

Radiation heat transfer. The radiation heat transfer between two parallel planes is reduced by placing a parallel aluminum sheet in the middle of the gap. The surface temperatures are  $T_1 = 40^\circ\text{C}$  and  $T_2 = 5^\circ\text{C}$ , respectively; the emissivities are  $\epsilon_1 = \epsilon_2 = 0.85$ . The emissivity of both sides of the aluminum is  $\epsilon_a = 0.05$ . Calculate by how much the radiation heat transfer is reduced due to the aluminum sheet; surface temperatures remain constant, and the surfaces are assumed to be gray.
