Radiation heat transfer. The radiation heat transfer between two parallel planes is reduced by placing a parallel aluminum sheet in the middle of the gap. The surface temperatures are $T_1 = 40^\circ\text{C}$ and $T_2 = 5^\circ\text{C}$, respectively; the emissivities are $\epsilon_1 = \epsilon_2 = 0.85$. The emissivity of both sides of the aluminum is $\epsilon_a = 0.05$. Calculate by how much the radiation heat transfer is reduced due to the aluminum sheet; surface temperatures remain constant, and the surfaces are assumed to be gray.

An extensive heat transfer library for EES was developed in conjunction with the heat transfer textbook and it is included with the Commercial and Professional versions. This library automates the computation of radiation view factors, conduction shape factors, convection heat transfer coefficients, fin efficiencies,...

Heat Transfer 2nd Edition Included

An energy transfer is heat transfer when its driving force is temperature difference. 1-10C

Thermal energy is the sensible and latent forms of internal energy, and it is referred to as heat in daily life. 1-11C For the constant pressure case. This is because the heat transfer to an ideal gas is $mC_p \Delta T$ at constant pressure and $mC_v \Delta T$ at constant volume, and C_p is always greater than C_v .
