Patient-centered, high-quality health care relies on the well-being, health, and safety of health care clinicians. However, alarmingly high rates of clinician burnout in the

United States are detrimental to the quality of care being provided, harmful to individuals in the workforce, and costly. It is important to take a systemic approach to address burnout that focuses on the structure, organization, and culture of health care. Taking Action Against Clinician Burnout: A Systems Approach to Professional Well-Being builds upon two groundbreaking reports from the past twenty years, To Err Is Human: Building a Safer Health System and Crossing the Quality Chasm: A New Health System for the 21st Century, which both called attention to the issues around patient safety and quality of care. This report explores the extent, consequences, and contributing factors of clinician burnout and provides a framework for a systems approach to clinician

burnout and professional well-being, a research agenda to advance clinician well-being, and recommendations for the field.

This User's Guide is intended to support the design, implementation, analysis, interpretation, and quality evaluation of registries created to increase understanding of patient outcomes. For the purposes of this guide, a patient registry is an organized system that uses observational study methods to collect uniform data (clinical and other) to evaluate specified outcomes for a population defined by a particular disease, condition, or exposure, and that serves one or more predetermined scientific, clinical, or policy purposes. A registry database is a file (or files) derived from the registry. Although registries can serve many purposes, this guide focuses on registries created for one or more of the following purposes: to describe the natural history of disease, to determine clinical effectiveness or cost-effectiveness of health care products and services, to measure or monitor safety and harm, and/or to measure quality of care. Registries are classified according to how their populations are defined. For example, product registries include patients who have been

exposed to biopharmaceutical products or medical devices. Health services registries consist of patients who have had a common procedure, clinical encounter, or hospitalization. Disease or condition registries are defined by patients having the same diagnosis, such as cystic fibrosis or heart failure. The User ' s Guide was created by researchers affiliated with AHRQ ' s Effective Health Care Program, particularly those who participated in AHRQ ' s DEcIDE (Developing Evidence to Inform Decisions About Effectiveness) program. Chapters were subject to multiple internal and external independent reviews.

The second edition of this book provides scientific and clinical insights on the management of patients who arrive at the hospital with a presentation consistent with a potential acute coronary syndrome. Focusing on the cardiology aspects of chest pain, it presents the science and methodology that has allowed the remarkable improvements in diagnostic accuracy and improved patient outcomes for the evaluation of patients presenting with suspected acute coronary syndromes. Chapters address key issues of the implementation of high sensitivity troponin and the use of contemporary non-invasive myocardial perfusion evaluation technologies (e.g., coronary artery computed tomography). It also addresses the cutting edge application of new technologies that promise to effect the early identification of coronary vascular disease. This new edition offers updated chapters as well as brand new chapters. Short Stay Management of Chest Pain is a valuable tool for acute care physicians, nurses, and hospital administrators devoted to caring for this population.
