Fundamentals of Chemistry: A Modern Introduction focuses on the formulas, processes, and methodologies used in the study of chemistry. The book first looks at general and historical remarks, definitions of chemical terms, and the classification of matter and states of aggregation. The text then discusses gases. Ideal gases; pressure of a gas confined by a liquid; Avogadro's Law; and Graham's Law are described. The book also discusses aggregated states of matter, atoms and molecules, chemical equations and arithmetic, thermochemistry, and chemical periodicity. The text also highlights the electronic structures of atoms. Quantization of electricity; spectra of elements; quantization of the energy of an electron associated with nucleus; the Rutherford-Bohr nuclear theory; hydrogen atom; and representation of the shapes of atomic orbitals are explained. The text also highlights the types of chemical bonds, hydrocarbons and their derivatives, intermolecular forces, solutions, and chemical equilibrium. The book focuses as well on ionic solutions, galvanic cells, and acids and bases. It also discusses the structure and basicity of hydrides and oxides. The reactivity of hydrides; charge of dispersal and basicity; effect of anionic charge; inductive effect and basicity; and preparation of acids are described. The book is a good source of information for readers wanting to study chemistry.

What kind of stuff is the world made of? What is the nature

or substance of things? These are ontological questions, and they are usually answered with respect to the objects of science. The objects of technoscience tell a different story that concerns the power, promise and potential of things – not what they are but what they can be.

Seventeen scholars from history and philosophy of science, epistemology, social anthropology, cultural studies and ethics each explore a research object in its technological setting, ranging from carbon to cardboard, from arctic ice cores to nuclear waste, from wetlands to GMO seeds, from fuel cells to the great Pacific garbage patch. Together they offer fascinating stories and novel analytic concepts, all the while opening up a space for reflecting on the specific character of technoscientific objects. With their promise of sustainable innovation and a technologically transformed future, these objects are highly charged with values and design expectations. By clarifying their mode of existence, we are learning to come to terms more generally with the furniture of the technoscientific world – where, for example, the 'dead matter' of classical physics is becoming the 'smart material' of emerging and converging technologies.

The Handy Chemistry Answer Book Taylor & Francis
Long considered the standard for honors and high-level mainstream general chemistry courses, PRINCIPLES OF MODERN CHEMISTRY continues to set the standard as the most modern, rigorous, and chemically and mathematically accurate text on the market. This authoritative text features an "atoms first" approach and thoroughly revised chapters on Quantum Mechanics and Molecular Structure (Chapter 6), Electrochemistry (Chapter 17), and Molecular Spectroscopy and Photochemistry (Chapter 20). In addition, the text utilizes mathematically accurate and artistic atomic and molecular

orbital art, and is student friendly without compromising its rigor. End-of-chapter study aids focus on only the most important key objectives, equations and concepts, making it easier for students to locate chapter content, while applications to a wide range of disciplines, such as biology, chemical engineering, biochemistry, and medicine deepen students' understanding of the relevance of chemistry beyond the classroom.
