" Science has a battle for hearts and minds on its hands....How good it feels to have Lisa Randall ' s

unusual blend of top flight science, clarity, and charm on our side. " —Richard Dawkins

" Dazzling ideas....Read this book today to understand the science of tomorrow. " —Steven Pinker The bestselling author of Warped Passages, one of Time magazine ' s " 100 Most Influential People in the World, " and one of Esquire ' s " 75 Most Influential People of the 21st Century, " Lisa Randall gives us an exhilarating overview of the latest ideas in physics and offers a rousing defense of the role of science in our lives. Featuring fascinating insights into our scientific future born from the author ' s provocative conversations with Nate Silver, David Chang, and Scott Derrickson, Knocking on Heaven ' s Door is eminently readable, one of the most important popular science books of this or any year. It is a necessary volume for all who admire the work of Stephen Hawking, Michio Kaku, Brian Greene, Simon Singh, and Carl Sagan; for anyone curious about the workings and aims of the Large Hadron Collider, the biggest and most expensive machine ever built by mankind; for those who firmly believe in the importance of science and rational thought; and for anyone interested in how the Universe began...and how it might ultimately end.

Holt Science Spectacular Penguin

From Jim Holt, the New York Times bestselling author of *Why Does the World Exist?*, comes an entertaining and accessible guide to the most profound scientific and mathematical ideas of recent centuries in *When Einstein Walked with Gödel: Excursions to the Edge of Thought*. Does time exist? What is infinity? Why do mirrors reverse left and right but not up and down? In this scintillating collection, Holt explores the human mind, the cosmos, and the thinkers who've tried to encompass the latter with the former. With his trademark clarity and humor, Holt probes the mysteries of quantum mechanics, the quest for the foundations of mathematics, and the nature of logic and truth. Along the way, he offers intimate biographical sketches of celebrated and neglected thinkers, from the physicist Emmy Noether to the computing pioneer Alan Turing and the discoverer of fractals, Benoit Mandelbrot. Holt offers a painless and playful introduction to many of our most beautiful but least understood ideas, from Einsteinian relativity to string theory, and also invites us to consider why the greatest logician of the twentieth century believed the U.S. Constitution contained a terrible contradiction—and whether the universe truly has a future.

A NEW YORK TIMES BESTSELLER "An informed and entertaining guide to what science can and cannot tell us." —The Wall Street Journal "Stimulating . . . encourage[s] readers to push past well-trod assumptions [...] and have fun doing so." —Science Magazine From renowned physicist and creator of the YouTube series "Science without the Gobbledygook," a book that takes a no-nonsense approach to life's biggest questions, and wrestles with what physics really says about the human condition Not only can we not currently explain the origin of the universe, it is questionable we will ever be able to explain it. The notion that there are universes within particles, or that particles are conscious, is ascientific, as is the hypothesis that our universe is a computer simulation. On the other hand, the idea that the universe itself is conscious is difficult to rule out entirely. According to Sabine Hossenfelder, it is not a coincidence that quantum entanglement and vacuum energy have become the go-to explanations of alternative healers, or that people believe their deceased grandmother is still alive because of quantum mechanics. Science and religion have the same roots, and they still tackle some of the same questions: Where do we come from? Where do we go to? How much can we know? The area of science that is closest to answering these questions is physics. Over the last century, physicists have learned a lot about which spiritual ideas are still compatible with the laws of nature. Not always, though, have they stayed on the scientific side of the debate. In this lively, thought-provoking book, Hossenfelder takes on the biggest questions in physics: Does the past still exist? Do particles think? Was the universe made for us? Has physics ruled out free will? Will we ever have a theory of everything? She lays out how far physicists are on the way to answering these questions, where the current limits are, and what questions might well remain unanswerable forever. Her book offers a no-nonsense yet entertaining take

on some of the toughest riddles in existence, and will give the reader a solid grasp on what we know—and what we don't know.
