The images in this book are in color. For a less-expensive grayscale paperback version, see ISBN 9781680923254. Prealgebra 2e is designed to

meet scope and sequence requirements for a one-semester prealgebra course. The text introduces the fundamental concepts of algebra while addressing the needs of students with diverse backgrounds and learning styles. Each topic builds upon previously developed material to demonstrate the cohesiveness and structure of mathematics. Students who are taking basic mathematics and prealgebra classes in college present a unique set of challenges. Many students in these classes have been unsuccessful in their prior math classes. They may think they know some math, but their

core knowledge is full of holes. Furthermore, these students need to learn much more than the course content. They need to learn study skills, time management, and how to deal with math anxiety. Some students lack basic reading and arithmetic skills. The organization of Prealgebra makes it easy to adapt the book to suit a variety of course syllabi.

Vocabulary from Classical Roots is a thematically organized vocabulary program based on Greek and Latin

roots. Each of the 16 lessons features 23 roots and 815 words derived from these roots. Words are presented with dictionary-style definitions, and all words are used in example sentences. Lists of Familiar Words and Challenge Words are provided for each root to help all students activate prior knowledge and keep advanced students on task. Exercises include synonym/antonym, fill in the blank, identification of incorrect usage, and analogies. Review activities including writing extensions, discussion questions, and other exercises are provided after every two

lessons. The themes presented in Book A include: Numbers, All or Nothing, More or Less, Before and After, Creativity, Travel, Sports, and Animals. An authorised reissue of the long
out of print classic textbook,

Advanced Calculus by the late Dr
Lynn Loomis and Dr Shlomo

Sternberg both of Harvard

University has been a revered but
hard to find textbook for the

advanced calculus course for
decades. This book is based on an
honors course in advanced
calculus that the authors gave in
the 1960's. The foundational
material, presented in the
unstarred sections of Chapters 1
through 11, was normally
covered, but different applications
of this basic material were
stressed from year to year, and the
book therefore contains more
material than was covered in any
one year. It can accordingly be
used (with omissions) as a text for
a year's course in advanced
calculus, or as a text for a three-
semester introduction to
analysis. The prerequisites are a
good grounding in the calculus of
one variable from a

mathematically rigorous point of
view, together with some
acquaintance with linear algebra.
The reader should be familiar with
limit and continuity type
arguments and have a certain
amount of mathematical
sophistication. As possible
introductory texts, we mention
Differential and Integral Calculus
by R Courant, Calculus by T
Apostol, Calculus by M Spivak,
and Pure Mathematics by G
Hardy. The reader should also
have some experience with partial
derivatives. In overall plan the
book divides roughly into a first
half which develops the calculus
(principally the differential
calculus) in the setting of normed
vector spaces, and a second half

which deals with the calculus of differentiable manifolds.
