Food packaging performs an essential function, but packaging materials can have a negative impact on the environment. This collection reviews bio-based, biodegradable and recycled materials and their current and potential applications for food protection and preservation. The first part of the book looks at the latest advances in bio-based food packaging materials. Part two discusses the factors involved in choosing alternative packaging materials such as consumer preference, measuring the environmental performance of food packaging, eco-design, and the safety and quality of recycled materials. Part three contains chapters on the applications of environmentally-compatible materials in particular product sectors, including the packaging of fresh horticultural produce, dairy products and seafood. This section also covers active packaging, modified atmosphere packaging and biobased intelligent food packaging. The book finishes with a summary of the legislation and certification of environmentally-compatible packaging in the EU. With its distinguished editor and contributors, Environmentally-compatible food packaging is a valuable reference tool for professionals in the food processing and packaging industries. Reviews bio-based, biodegradable and recycled materials and their current and potential applications Discusses consumer preference, environmental performance, eco-design and the quality of recycled materials as factors involved in choosing alternative packaging materials Summarises EU legislation and certification of environmentally compatible packaging

[Inventory of Average Greenhouse Gas Emissions for Denmark, Norway and Sweden](#) Elsevier

The purpose of this project is to compare emissions of greenhouse gases from material recycling with those from virgin material production, both from a material supply perspective and from a recycling system perspective. The method for estimating emissions and climate benefits is based on a review, followed by a selection, of the most relevant publications on life cycle assessment (LCA) of materials for use in Denmark, Norway and Sweden. The proposed averages show that emissions from material recycling are lower in both perspectives, comparing either material supply or complete recycling systems. The results can be used by companies and industry associations in Denmark, Norway and Sweden to communicate the current climate benefits of material recycling in general. They may also contribute to discussions on a societal level, as long as their average and historic nature is recognised.

#1 Bestseller in waste management Stop Garbage sheds some light on the world of waste and recycling, topics often filled with questions for most readers. Do we really know why it's important to recycle and the consequences of not doing it? What environmental impact does our behavior have? What trends will prevail in waste management during the next decade? Far from being a technical book, Stop Garbage introduces us to the field of waste and recycling in a clear and enjoyable way. It deals with garbage or waste, whatever you want to call it, but in it you will also find a kidnapping, a destroyer, successes, food waste, the biggest dump in the world, the first incinerator, questions about money and employment or riddles: how many times can you fill the Camp Nou Stadium with one year's waste? How many trees do we save from felling if we recycle paper? What's the best waste in the world? Added to this, multimedia content, articles and videos make up a didactic book of reading which is, without a shadow of a doubt, entertaining. After years of experience in the sector, Alex Pascual (Barcelona, 1976) brings us closer to the key concepts that can help us to formulate our own opinion on the subject. A book full of vital data as well as funny anecdotes that will trigger successive reflections on waste management, undoubtedly one of the pillars of the contemporary and future commitment to the environment.

About the author Industrial Engineer specialist in waste management, street cleaning and public services. He has been working in the private sector for many years and now, after more than nine years works as a public services chief for a city council. Paper recycling in an increasingly environmentally conscious world is gaining importance. Increased recycling activities are being driven by robust overseas markets as well as domestic demand. Recycled fibers play a very important role today in the global paper industry as a substitute for virgin pulps. Paper recovery rates continue to increase year after year Recycling technologies have been improved in recent years by advances in pulping, flotation deinking and cleaning/screening, resulting in the quality of paper made from secondary fibres approaching that of virgin paper. The process is a lot more eco-friendly than the virgin-papermaking process, using less energy and natural resources, produce less solid waste and fewer atmospheric emissions, and helps to preserve natural resources and landfill space. Currently more than half of the paper is produced from recovered papers. Most of them are used to produce brown grades paper and board but for the last two decades, there is a substantial increase in the use of recovered papers to produce, through deinking, white grades such as newsprint, tissue, market pulp. By using recycled paper, companies can take a significant step toward reducing their overall environmental impacts. This study deals with the scientific and technical advances in recycling and deinking including new developments. Covers in great depth all the aspects of recycling technologies Covers the latest science and technology in recycling Provides up-to-date, authoritative information and cites many mills experiences and pertinent research Includes the use of biotech methods for deinking, refining, and improving drainage
