The purpose of this project is to compare emissions of greenhouse gases from material recycling with those from virgin material production, both from a material supply perspective and from a recycling system perspective. The method for estimating emissions and climate benefits is based on a review, followed by a selection, of the most relevant publications on life cycle assessment (LCA) of materials for use in Denmark, Norway and Sweden. The proposed averages show that emissions from material recycling are lower in both perspectives, comparing either material supply or complete recycling systems. The results can be used by companies and industry associations in Denmark, Norway and Sweden to communicate the current climate benefits of material recycling in general. They may also contribute to discussions on a societal level, as long as their average and historic nature is recognised.

Paper is the largest single component of municipal solid waste, and the recycling of paper must be part of any resolution to the current garbage crisis. Because there are no uniform standards for the generic term "recycled," it is still difficult for paper users to make environmentally responsible purchasing decisions. Myths, misinformation, and confusion abound. This first comprehensive guide to recycled printing and writing papers will therefore be an invaluable resource for anyone involved with printing, production, design, or issues of recycling in general. The book itself, printed on four different types of recycled paper, is a demonstration of the quality that informed designers and publishers can achieve. In concise, nontechnical language, Claudia Thompson explains the dimensions of the solid waste problem, the history of papermaking, the elements of recycled paper production (including current definitions and standards), the physical properties and printing characteristics of recycled papers, the potential impact of designers on recycling, and possibilities for the future. Recycled Papers: The Essential Guide was sponsored by the American Institute of Graphic Arts under the direction of Claudia Thompson, a graphic designer and Principal of Claudia Thompson Design in Cambridge, Massachusetts. Ms. Thompson's work on environmental issues started with the first Earth Day in 1970, and she has been researching the subject of recycled papers since 1988.

A sustainable lifestyle starts in the kitchen with these use-what-you-have, spend-less-money recipes and tips, from the friendly voice behind @ZeroWasteChef. In her decade of living with as little plastic, food waste, and stuff as possible, Anne-Marie Bonneau, who blogs under the moniker Zero-Waste Chef, has learned that "zero-waste" is above all an intention, not a hard-and-fast rule. Because,

while one person eliminating all their waste is great, if thousands of people do 20 percent better it will have a much bigger impact on the planet. The good news is you likely already have all the tools you need to begin to create your own change at home, especially in the kitchen. In her debut book, Bonneau gives readers the facts to motivate them to do better, the simple (and usually free) fixes to ease them into wasting less—you can, for example, banish plastic wrap by simply inverting a plate over your leftovers--and, finally, the recipes and strategies to turn them into more sustainable, money-saving cooks. Rescue a loaf from the landfill by making Mexican Hot Chocolate Bread Pudding, or revive some sad greens to make a pesto. Save five bucks (and the plastic tub) at the supermarket with Yes Whey, You Can Make Ricotta Cheese, then use the cheese in a galette and the leftover whey to make sourdough tortillas. With 75 vegan and vegetarian recipes for cooking with scraps, creating fermented staples, and using up all your groceries before they become waste—including end-of-recipe tips on what to do with your ingredients next--Bonneau lays out an attainable vision of a zero-waste kitchen.

The State of the World's Land and Water Resources for Food and Agriculture is FAO's first flagship publication on the global status of land and water resources. It is an 'advocacy' report, to be published every three to five years, and targeted at senior level decision makers in agriculture as well as in other sectors. SOLAW is aimed at sensitizing its target audience on the status of land resources at global and regional levels and FAO's viewpoint on appropriate recommendations for policy formulation. SOLAW focuses on these key dimensions of analysis: (i) quantity, quality of land and water resources, (ii) the rate of use and sustainable management of these resources in the context of relevant socio-economic driving factors and concerns, including food security and poverty, and climate change. This is the first time that a global, baseline status report on land and water resources has been made. It is based on several global spatial databases (e.g. land suitability for agriculture, land use and management, land and water degradation and depletion) for which FAO is the world-recognized data source. Topical and emerging issues on land and water are dealt with in an integrated rather than sectoral manner. The implications of the status and trends are used to advocate remedial interventions which are tailored to major farming systems within different geographic regions.

On the Secret Trail of Trash Penguin
A “fascinating [and] downright entertaining” look at what we throw away—and where it all goes (Booklist, starred review). Out of sight, out of mind? Into our trash cans go dead batteries, dirty diapers, bygone burritos, broken toys, tattered socks, eight-track cassettes, scratched CDs, banana peels.... But where do these things go next? In a country that consumes and then casts off more and more, what actually happens to the things we throw away? In Garbage Land, science writer Elizabeth Royte leads us on a wild adventure to answer that question. Along the way, we meet an odor chemist who explains why trash smells so bad; garbage fairies and recycling gurus; neighbors of massive waste dumps; CEOs making fortunes by encouraging waste or encouraging recycling—often both at the same time; scientists trying to revive our most polluted places; fertilizer fanatics and adventurers who kayak amid sewage; paper people, steel people, aluminum people, plastic people, and even a guy who swears by recycling human waste. With a wink and a nod and a tightly clasped nose, Royte takes us on a bizarre cultural tour through slime, stench, and heat—in other words, through the back end of our ever-more supersized lifestyles. By showing us what happens to the things we’ve “disposed of,” Royte reminds us that our decisions about consumption and waste have a very real impact—and that unless we undertake radical change, the garbage we create will always be with us: in the air we breathe, the water we drink, and the food we consume. Garbage Land is a brilliant exploration into the soiled heart of the American trash can. “The author’s adventures in waste management provide a riveting travelog punctuated by a scathing indictment of

American consumption.” —Wired “A thorough, perceptive, graceful, and often witty writer.” —Washington Monthly

A Guide to Better Recycling and How to Reduce Single-Use Plastics Springer
#1 Bestseller in waste management Stop Garbage sheds some light on the world of waste and recycling, topics often filled with questions for most readers. Do we really know why it's important to recycle and the consequences of not doing it? What environmental impact does our behavior have? What trends will prevail in waste management during the next decade? Far from being a technical book, Stop Garbage introduces us to the field of waste and recycling in a clear and enjoyable way. It deals with garbage or waste, whatever you want to call it, but in it you will also find a kidnapping, a destroyer, successes, food waste, the biggest dump in the world, the first incinerator, questions about money and employment or riddles: how many times can you fill the Camp Nou Stadium with one year's waste? How many trees do we save from felling if we recycle paper? What's the best waste in the world? Added to this, multimedia content, articles and videos make up a didactic book of reading which is, without a shadow of a doubt, entertaining. After years of experience in the sector, Alex Pascual (Barcelona, 1976) brings us closer to the key concepts that can help us to formulate our own opinion on the subject. A book full of vital data as well as funny anecdotes that will trigger successive reflections on waste management, undoubtedly one of the pillars of the contemporary and future commitment to the environment. About the author Industrial Engineer specialist in waste management, street cleaning and public services. He has been working in the private sector for many years and now, after more than nine years works as a public services chief for a city council. He also writes on a blog about the same subject www.stopgarbage.com, Twitter profile @stopbasural and on Instagram as @stopbasura. Readers reviews " It is a very affordable book for anyone who wants to know how the recycling system works in Spain. With a simple language and away from the technicalities, step by step the writer introduces you to why it is important to recycle, the main magnitudes in our country and the recycling process of each container ." Nicolás "This is a good book to understand the garbage and what represents in our society. It is impressive to read the data and interpretation that the author gives us ..."Luis "Very good book, practical, with a surprising data that reveals and the clarity of the explanation. Despite containing a large amount of information, its reading is enjoyable and facilitated by numerous graphics, links to websites, etc. The book really opens your eyes to the world of recycling! Highly recommended. "Dani

Recycling Gets Down to Business MIT Press (MA)
The U.S. consumed more than 60 million tons of paper and paperboard in 1973, about 20 percent of which was recycled. Steel is the only product that is consumed in larger quantities than paper. The principal disincentives for paper recycling are: (1) the ready availability of virgin wood fibers, (2) lack of research on recycling of paper, (3) economics favor the use of virgin fibers, and (4) contaminants in wastepaper present major problems in recycling. In spite of the large amount of wastepaper that is available, a wastepaper shortage occurred in 1973 and has continued into 1974 because of problems in collection, fluctuation of the wastepaper market, and lack of manufacturing capacity. It is anticipated that about 32 million tons of paper and paperboard are available for recycling. About 130 pulp mills with a capacity of 600 tons per day would be needed to recycle this amount of wastepaper, which would produce about 24 million tons of recycled paper. The capital for building these mills is not available, and if a large number of secondary fiber mills were built immediately, it would create chaos in the virgin fiber industry. It is suggested that market pulp mills, located in or near large municipalities, be erected as needed to

provide the need for more market pulp. This secondary pulp would be available to many mills that now are not equipped to process wastepaper.

Food packaging performs an essential function, but packaging materials can have a negative impact on the environment. This collection reviews bio-based, biodegradable and recycled materials and their current and potential applications for food protection and preservation. The first part of the book looks at the latest advances in bio-based food packaging materials. Part two discusses the factors involved in choosing alternative packaging materials such as consumer preference, measuring the environmental performance of food packaging, eco-design, and the safety and quality of recycled materials. Part three contains chapters on the applications of environmentally-compatible materials in particular product sectors, including the packaging of fresh horticultural produce, dairy products and seafood. This section also covers active packaging, modified atmosphere packaging and biobased intelligent food packaging. The book finishes with a summary of the legislation and certification of environmentally-compatible packaging in the EU. With its distinguished editor and contributors, Environmentally-compatible food packaging is a valuable reference tool for professionals in the food processing and packaging industries. Reviews bio-based, biodegradable and recycled materials and their current and potential applications Discusses consumer preference, environmental performance, eco-design and the quality of recycled materials as factors involved in choosing alternative packaging materials Summarises EU legislation and certification of environmentally compatible packaging

The Prostitute State - How Britain's Democracy Has Been Bought Rodale

A Political Insider’s Account of How Britain’s Democracy Has Been Bought. Donnachadh McCarthy, former Deputy Chair of the Liberal Democrats, describes how a corporate elite have captured Britain’s democracy. Legions of former and current British politicians are in the pay of corporations. Party political funding is awash with tax-haven donors. Our media has been hijacked by 5 right-wing billionaires. Academia is being captured by corporate interests. The production of thought, the dissemination of thought, the implementation of thought and the wealth arising from those thoughts, are now controlled by a tiny,rich elite. The UK is no longer a functioning democracy but The Prostitute State. This State has 4 Pillars: A Corrupted Political System, A Prostituted Media, A Perverted Academia and A Thieving Tax-Haven System. It has resulted in wealth flooding from the poor to the top 1% and in ecological destruction. This book is a clarion call for A Great 21st Century Democratic Reform Act.
