How to construct (draw) a regular hexagon inscribed in a circle with a compass and straightedge or ruler. This is the largest hexagon that will fit in the circle, with each vertex touching the circle. In a regular hexagon, the side length is equal to the distance from the center to a vertex, so we use this fact to set the compass to the proper side length, then step around the circle marking ...

The simplest way to draw a hexagon in AutoCAD is to use the polygon tool, entering six as the number of sides. If you know the radius you'd like to use, then you can choose to size the polygon from the center. You can then choose if you want the hexagon inscribed within the radius, or circumscribed outside the radius.
