For a slightly more complex case, we can supplement basic engineering equations with stress concentration factors from a structures text (such as Roark) to determine peak stress: However, with just a little more complexity, the engineering equations are no longer sufficient to determine peak stress. FEA is the best choice.

~~Solution: The solution is to employ an iterative computational technique in Inventor Stress Analysis called convergence. Each iteration modifies the mesh, re-runs the simulation, and compares the results to the previous results. Performing a convergence study in Inventor Stress Analysis refines the mesh and reduces the size of the elements, which will theoretically increase the accuracy of the next iteration of results.~~
