Introduction to Particle Technology
American Chemical Society

Particle technology is a term used to refer to the science and technology related to the handling and processing of particles and powders. The production of particulate materials, with controlled properties tailored to subsequent processing and applications, is of major interest to a wide range of industries, including chemical and process,

food, pharmaceuticals, minerals and metals companies and the handling of particles in gas and liquid solutions is a key technological step in chemical engineering. This textbook provides an excellent introduction to particle technology with worked examples and exercises. Based on feedback from students and practitioners worldwide, it has been newly edited and contains new chapters on slurry transport, colloids and fine particles, size enlargement and the health effects of fine powders. Topics covered include: Characterization (Size Analysis) Processing (Granulation, Fluidization) Particle Formation (Granulation, Size Reduction) Storage and Transport (Hopper Design, Pneumatic Conveying, Standpipes, Slurry Flow)

Separation (Filtration, Settling, Cyclones)
Safety (Fire and Explosion Hazards, Health
Hazards) Engineering the Properties of
Particulate Systems (Colloids, Respirable
Drugs, Slurry Rheology) This book is
essential reading for undergraduate students
of chemical engineering on particle
technology courses. It is also valuable
supplementary reading for students in other
branches of engineering, applied chemistry,
physics, pharmaceuticals, mineral processing
and metallurgy. Practitioners in industries in
which powders are handled and processed
may find it a useful starting point for gaining
an understanding of the behavior of particles
and powders. Review of the First Edition

The Film Developing Cookbook is an up-to-date
manual for modern film development techniques.
While the original Darkroom Cookbook focused
entirely on photographic chemicals and formulae,
this book concentrates on films, their characteristics,
and the developers each requires for maximum
control of the resulting image. The Film Developing
Cookbook specifically addresses the difficult subject
of T-grain film development. It includes rarely found
information on film development and the nature of
film developers. The authors take bold and
controversial stances on many widely accepted film
developing dogmas. They tackle many of the widely

accepted "myths" of film development. They reject the trend toward 'scientific evaluation' of films and developers in favor of the photographer developing a personal aesthetic without relying exclusively on densitometry or H&D curves. Steve Anchell is a contributing editor to *Outdoor Photographer* and *PhotoWork* magazines. He has written columns, feature articles, and interviews for *Camera & Darkroom*, *View Camera*, *PIC*, *Shutterbug*, *Photo Shopper*, and *PhotoPro* magazines. His previous two books with Focal Press, *The Darkroom Cookbook* and *The Variable Contrast Printing Manual* are photography best-sellers. Steve's photographs have been exhibited in galleries and are shown in private collections. He photographs and prints both color and black-and-white with 35mm, 21 / 4 and large-format cameras. He has conducted over 80 photographic and darkroom workshops since 1979. Steve is currently the program director for the *Photographer's Formulary Workshops* in Condon, Montana. In early 1998, the first collection of his

personal work, entitled *The Nude at Big Sur*, will be published by Whitefish Editions. Bill Troop is a highly respected independent photochemist.

This textbook covers basic principles of equilibrium behavior for systems of interest to chemical engineering, including elementary microscopic concepts. A strong

emphasis is placed on fundamentals: energy conservation in open and closed systems (first law), temperature, entropy and reversibility (second law), fundamental equations, and criteria for equilibrium and stability. These concepts are then applied to the analysis of energy conversion processes, mixing, phase equilibria, and chemical reactions.

The motion of water on a uniformly sloping beach, just after a bore reaches the shore, is studied. The shallow-water equations are used to formulate a singular hyperbolic problem, which is solved by the help of RIEMANN'S Method and of the structural theory of quasilinear hyperbolic equations

developed in gas dynamics. The shore line is found to advance suddenly with non-zero velocity and then to move up and down the beach with constant, negative acceleration. The solution is shown to contain limit lines indicating a rather unexpected, secondary bore in the backwash. (Author).

A guide to the principles and methods of air quality assessment aimed at measuring population exposure to ambient air pollutants and estimating the effects on health. Addressed to policy-makers as well as scientists engaged in air quality monitoring, the book responds to the failure of most monitoring systems to provide data that

are useful in estimating and managing threats to health. The need for exposure data on populations at special risk is also addressed. Throughout, emphasis is placed on methods of monitoring and modelling that are cost-effective, targeted, and appropriate to local and national conditions. The report has six chapters. The first introduces WHO activities related to air quality management and explains the need for monitoring systems capable of assessing health impact. The types of information required for health impact assessment are described in chapter two, which outlines several methods of monitoring and modelling that can be used to measure the level and

distribution of exposure to air pollutants in populations, identify population groups with high exposure, and estimate adverse effects on health. Chapter three formulates a general concept of air quality assessment, offering advice on principles for designing a monitoring network, interpreting and reporting data, and solving problems with quality assurance. Also included is a comparison of the advantages, disadvantages, and costs of different methods for air quality monitoring. Against this background, the fourth and most extensive chapter describes specific methods for the monitoring of carbon monoxide, ozone, sulfur dioxide, nitrogen dioxide, particulate matter,

benzene, polycyclic aromatic hydrocarbons, lead, and atmospheric cadmium. Monitoring strategies for each pollutant are presented according to a standard format, which covers health effects, sources and exposure patterns, monitoring methods, recommended strategies for monitoring and assessment, and a practical example. The remaining chapters offer advice on the collation, analysis, interpretation, and dissemination of data, and summarize the main conclusions and recommendations of the report. Detailed technical guidelines for the use of various methods and models are provided in a series of annexes. The report also reproduces the newly revised

WHO air quality guidelines for Europe.
