In this thesis, the ionization of atoms and small molecules in strong laser fields is experimentally studied using a reaction microscope. The population of autoionizing doubly excited states in the laser fields is proven and a possible connection to the well- 31st International known dielectronic recombination processes in Alpe-Adria-Danube is discussed. The fundamental process of tunnel ionization in strong laser fields is subject of investigation in a pump-several countries on probe experiment with ultrashort laser pulses. A coherent superposition of electronic states in singly charged argon ions is created within the first, and subsequently tunnelionized with the second robotic systems, pulse. This gives access to stateselective information about the tunneling process and allows to test common models. Moreover, the ionization of krypton and argon at different wavelengths is studied, inspired and swarm from the multiphoton to robotic systems, the tunneling regime. The wavelengthdependent investigations are furthermore extended to and bionic prostheses, molecular hydrogen. In cognitive robots, addition to ionization, cloud robotics, this system might undergo different dissociative processes. etc. Given its scope, Channel-selective electron momentum distributions are

Microtimes Graphic Communications Group This book presents the proceedings of the Conference on Robotics Region (RAAD), held in Klagenfurt, Austria, June 8-10, 2022. It gathers contributions by researchers from all major areas of robotic research, development and innovation, as well as new applications and current trends. The topics covered include: novel designs and applications of intelligent cooperating and service robots, advanced robot control, human-robot interfaces, robot vision systems, mobile robots, humanoid and walking robots, bioaerial, underwater and spatial robots, robots for ambient assisted living, medical robots ethical and social issues in robotics, the book offers a source of information and inspiration for

Expansión Lasers continue to be an amazingly robust field of activity. Anyone seeking a photon source is now confronted with an enormous number of laser wavelengths to choose from, but no single, comprehensive source to help them make that choice. The Handbook of Lasers provides an authoritative compilation of lasers, their properties, and original references in a readily accessible form. Organized by lasing media-solids, liquids, and gaseseach section is subdivided into distinct laser types. Each type carries a brief description, followed by tables listing the lasing element or medium, host, lasing transition and wavelength, operating properties, primary literature citations, and, for broadband lasers, reported tuning ranges. The

importance and value of the Handbook of Lasers cannot be overstated. Serving as both an archive and as an indicator of emerging trends, it reflects the state of knowledge and development in the field, provides a rapid means of obtaining reference data, and offers a pathway to the literature. It contains data useful for comparison with predictions and for developing models of processes, and mav reveal fundamental inconsistencies or conflicts in the data.
