Public health officials and organizations around the world remain on high alert because of increasing concerns about the prospect of an influenza pandemic, which many experts believe to be inevitable. Moreover, recent problems with the availability and strain-specificity of vaccine for annual flu epidemics in some countries and the rise of pandemic strains of avian flu in disparate geographic regions have alarmed experts about the world's ability to prevent or contain a human pandemic. The workshop summary, *The Threat of Pandemic Influenza: Are We Ready?* addresses these urgent concerns. The report describes what steps the United States and other countries have taken thus far to prepare for the next outbreak of "killer flu." It also looks at gaps in readiness, including hospitals' inability to absorb a surge of patients and many nations' incapacity to monitor and detect flu outbreaks. The report points to the need for international agreements to share flu vaccine and antiviral stockpiles to ensure that the 88 percent of nations that cannot manufacture or stockpile these products have access to them. It chronicles the toll of the H5N1 strain of avian flu currently circulating among poultry in many parts of Asia, which now accounts for the culling of millions of birds and the death of at least 50 persons. And it compares the costs of preparations with the costs of illness and death that could arise during an outbreak.

General pathology works nomothetically, whereas specific pathology works idiographically. Modern pathological anatomy on the other hand seeks to rise above the level of merely gathering data and to proceed to a practical knowledge of defined pathological aspects and patterns. JEAN MARTIN CHARCOT's conception of the entire morbid as the abstract basis of nosologically independent phenomena is paradigmatically corroborated in an especially impressive way by the study of tropical diseases. And so the idea suggested itself that we should present the main pathological patterns from the field of tropical pathology with particular reference to their interconnection. We soon came to the firm conclusion that such a compilation could be successfully undertaken only by a pathologist from the English-speaking world. The classic practical knowledge of our British colleagues, which has matured in world-wide experience, would be bound to find its ideal verification here. And so we turned for help to our friend Prof. WALTER PAGEL (Dr. med., Dr. h. c. Basle, Dr. h. c. Heidelberg) in London. He immediately referred us to Prof. HERBERT SPENCER. That we managed to enlist the help of Professor SPENCER is entirely due to Professor PAGEL's kind offices. We owe the fact that the undertaking has been completed in relatively so short a time to Professor SPENCER's exceptional knowledge both of his subject and of the field-workers themselves.

In a series of entertaining essays, geoscientist Jelle Zeilinga de Boer describes how early settlers discovered and exploited Connecticut's natural resources. Their successes as well as failures form the very basis of the state's history: Chatham's gold played a role in the acquisition of its Charter, and Middletown's lead helped the colony gain its freedom during the Revolution. Fertile soils in the Central Valley fueled the state's development into an agricultural power house, and iron ores discovered in the western highlands helped trigger its manufacturing eminence. The Statue of Liberty, a quintessential symbol of America, rests on Connecticut's Stony Creek granite. Geology not only shaped the state's physical landscape, but also provided an economic base and played a cultural role by inspiring folklore, paintings, and poems. Illuminated by 50 illustrations and 12 color plates, *Stories in Stone* describes the marvel of Connecticut's geologic diversity and also recounts the impact of past climates, earthquakes, and meteorites on the lives of the people who made Connecticut their home.
