"Architect Tom Kundig is known worldwide for the originality of his work. This paperback edition of Tom Kundig: Houses, first published in 2006, collects five of his most prominent early residential projects, which remain touchstones for him today. In a new preface written for this edition, Kundig reflects on the influence that these designs continue to have on his current thinking. Each house, presented from conceptual sketches through meticulously realized details, is the product of a sustained and active collaborative process among designer, builder, and client. The work of the Seattle-based architect has been called both raw and refined--disparate characteristics that produce extraordinarily inventive designs inspired by both the industrial structures ubiquitous to his upbringing in the Pacific Northwest and the vibrant craft cultures that are fostered there." --

A number of scar revision techniques can be utilized to treat specific types of scars, in combination with each other or with adjunctive therapies to achieve optimal results. Pathological conditions like hypertrophic scars and keloids are still challenging. Though a number of therapies exist to treat keloids, such as intralesional steroids and anti-metabolites, cryosurgery, to name a few, none are definitive in treatment. Understanding the molecular basis of keloids may lead to development of new therapies. Striae, also known as ‘ stretch marks ’ , are extremely common, disfiguring and a real challenge to treat. Management of striae is a neglected field of research. Except for topical retinoids, the efficacy satisfactorily. Current treatment options include chemical peels, lasers and collagen induction therapy, with a tendency towards active intervention. However, studies are necessary to determine treatment strategies which produce results that are effective with minimal adverse effects. Post-acne scarring is one of the most common causes of facial scars, causing considerable cosmetic disability. Acne is a common skin disorder, unfortunately affecting a large number of teenagers. Usually patients have a combination of different types of scars; hence no single modality is useful. A combination of procedures is generally required for a satisfactory cosmetic outcome. The use of fractional lasers is gaining importance, as it is a minimally invasive procedure as compared to aggressive resurfacing procedures of the past. Collagen induction therapy is another promising technique. Today, patients are also getting up-to-date information about the various modalities available for scar treatment through media, such as magazines, advertisements and internet. However, exaggerated advertisements and information from nonprofessional sources, particularly with regard to lasers can influence patient expectations and result in unrealistic expectations. Patients need to understand that deep scars cannot be eliminated fully and can only be improved. They usually have high expectations from procedural techniques. Proper counseling is extremely important for a happy and satisfactory outcome. Current innovations and techniques in scar prevention and management and increasing use of minimally invasive surgeries are paving the way toward smoother, less noticeable scars. Every surgeon practicing aesthetics should be well versed with modalities of scar management and this is the aim of this clinical update.
