The definitive story of a game so great, even the Cold War couldn't stop it. Tetris is perhaps the most instantly recognizable, popular video game ever made. But how did an obscure Soviet programmer, working on frail, antiquated computers, create a product which has now earned nearly 1 billion in sales? How did a makeshift game turn into a worldwide sensation, which has been displayed at the Museum of Modern Art, inspired a big-budget

sci-fi movie, and been played in outer space? A quiet but brilliant young man, Alexey Pajitnov had long nurtured a love for the obscure puzzle game pentominoes, and became obsessed with turning it into a computer game. Little did he know that the project that he labored on alone, hour after hour, would soon become the most addictive game ever made. In this fast-paced business story, reporter Dan Ackerman reveals how Tetris became one of the world's first viral hits, passed from player to player, eventually breaking through the Iron Curtain into the West. British, American, and Japanese moguls waged a bitter fight over the rights, sending their fixers racing around the globe to secure backroom deals, while a secretive Soviet organization named ELORG chased down the game's growing global profits. The Tetris Effect is an homage to both creator and creation, and a must-read for anyone who's ever played the game—which is to say everyone.

A number of scar revision techniques can be utilized to treat specific types of scars, in combination with each other or with adjunctive therapies to achieve optimal results. Pathological conditions like hypertrophic scars and keloids are still challenging. Though a number of therapies exist to treat keloids, such as intralesional steroids and anti-metabolites, cryosurgery, to name a few, none are definitive in treatment. Understanding the molecular basis of keloids may lead to development of new therapies. Striae, also known as 'stretch marks', are extremely common, disfiguring and a real challenge to treat. Management of striae is a neglected field of research. Except for topical retinoids, the efficacy satisfactorily. Current treatment options include chemical peels, lasers and collagen induction therapy, with a tendency towards active intervention. However, studies are necessary to determine treatment strategies which produce results that are effective with minimal adverse effects. Post-acne scarring is one of the most common causes of facial scars, causing considerable cosmetic disability. Acne is a common skin disorder, unfortunately affecting a large number of teenagers. Usually patients have a combination of different types of scars; hence no single modality is useful. A combination of procedures is generally required for a satisfactory cosmetic outcome. The use of fractional lasers is gaining importance, as it is a minimally invasive procedure as compared to aggressive resurfacing procedures of the past. Collagen induction therapy is another promising technique. Today, patients are also getting up-to-date information about the various modalities available for scar treatment through media, such as magazines, advertisements and internet. However, exaggerated advertisements and information from nonprofessional sources, particularly with regard to lasers can influence patient expectations and result in unrealistic expectations. Patients need to understand that deep scars cannot be eliminated fully and can only be improved. They usually have high expectations from procedural techniques. Proper counseling is extremely important for a happy and satisfactory outcome. Current innovations and techniques in scar prevention and

management and increasing use of minimally invasive surgeries are paving the way toward smoother, less noticeable scars. Every surgeon practicing aesthetics should be well versed with modalities of scar management and this is the aim of this clinical update.
