The ultimate guide to predicting winners and losers in high technology Pip Coburn became famous for writing some of the liveliest reports on Wall Street. He quoted everyone from Machiavelli to HAL, Anaïs Nin to Yoda, Einstein to Gandhi. But along with the quirky writing, he consistently delivered sharp insights into technology trends and helped investors pick stocks with long-term potential. After years of studying countless winners and losers, Coburn has come up with a simple idea that explains why some technologies become huge hits (iPods, DVD players, Netflix), but others never reach more than a tiny audience (Segways, video phones, tablet PCs). He says that people are only willing to change when the pain of their current situation outweighs the perceived pain of trying something new. In other words, technology demands a change in habits, and that's the leading cause of failure for countless cool inventions. Too many tech companies believe in "build it and they will come"—build something better and people will beat a path to your door. But, as Coburn shows, most potential users are afraid of new technologies, and they need a really great reason to change. The Change Function is an irreverent look at how this pattern plays out in countless sectors, from computers to cell phones to digital TV recorders. It will be an invaluable book for people who create and invest in new technologies.

"Who was Vatsyayana? What motivated this intriguing personality in the third century to compile ancient erotic texts, replete with his witty aphorisms, into the Kama Sutra, the ultimate treatise on love and the art of lovemaking? Kama is a fictionalised account of the life and times of Vatsyayana. Seemingly, a manual for the hedonist about town, the Kama Sutra reveals another tale—written in blood—of broken hearts, lyrical violence, ageless love, and unbridled lust! Set in 273 AD, in a land fraught with war and unrest, Kama is the story of a catastrophic day in a writer-artist's life that sets him off on a journey unto himself, beyond the boundaries of love, family and betrayal. This fast-paced story of tragedy and triumph beguiles and captivates as it flits seamlessly between an agonising past, an erotic present and a cataclysmic future."

Many railway modellers include an engine shed somewhere on their layout. However, all too often the shed is squeezed into a quite improbable location and is little more than a place to 'park' engines when they are not in use. This well-illustrated and comprehensive book, written by an experienced railway modeller, helps even the beginner to develop a far more realistic approach and to capture the unforgettable grimy but exciting atmosphere of the locomotive shed in the steam era. The book covers all types of engine shed from the branch line sub-shed to the main line motive power depot, and discusses research, planning, the building process, readily available materials and simple tools. It goes on to explain how to obtain the very best from kits, how to site and operate sheds, and how to make them look authentic. It demonstrates the construction of over a dozen kits, including off-the-shelf kits and the newest computer downloadable kits, and shows the modeller how to create special dioramas depicting the whole shed scene and how to scratch-build complete sheds, including coal stages and other infrastructure. With further advice for those with a limited amount of space, and 'top tips' throughout, this is essential reading for modellers of all abilities who wish to incorporate a realistic locomotive shed of the steam era into their layout. Well illustrated with 323 colour photographs.

Translation in Systems Crowood

A critically acclaimed foundational text, *Translation in Systems* offers a comprehensive guide to the descriptive and systemic approaches which have shaped translation studies. Theo Hermans considers translation norms, equivalence, polysystems and social systems, covering a wide range of theorists in his discussion of the principles of translation studies. Reissued with a new foreword by Kathryn Batchelor, which updates the text for a new generation of readers, *Translation in Systems* endures partly on account of Hermans's vivid and articulate writing style. The book covers the fundamental problems of translation norms, equivalence, polysystems and social systems, encompassing not only the work of Levý, Holmes, Even-Zohar, Toury, Lefevre, Lambert, Bassnett, D'hulst and others, but also giving special attention to contributions derived from Pierre Bourdieu and Niklas Luhmann. Hermans explains how contemporary descriptive approaches came about, what the basic ideas were, how those ideas have evolved over time, and offers a critique of these approaches. With practical questions of how to investigate translation (including problems of definition, description and assessment of readerships), this is essential reading for graduate students and researchers in translation studies and related areas.

The details of the receptor mechanism are not yet fully understood for any sensory system.

However, sufficient data are available (for the vestibular system and for other systems) to permit meaningful tracking of the sensory messages through the nervous system and via conscious experience. The reception, processing, storage and output of information in man and other animals, as done by means of receptors, neurons, secretory cells and muscle fibers, are collectively referred to as mind. Sensory physiologists tend to disbelieve in extrasensory perception. Sensory physiology in general is an area upon which different sciences and methods converge.

Anatomists, physiologists, psychologists, physicists, chemists, and engineers have made important contributions to sensory physiology. What is special about vestibular physiology is the fact that many research workers are clinicians, living under the constant pressure of their patient's demands. This is a disadvantage when it comes to writing handbooks, but an advantage for the patient, since research is guided by clinical practice and can be quickly applied. Modern methods, such as recording from single nerve units and the correlation of electrophysiological and psychophysical data, have greatly contributed to our knowledge, yet the study of lesions is still important, especially in the vestibular field.
