A critically acclaimed foundational text, *Translation in Systems* offers a comprehensive guide to the descriptive and systemic approaches which have shaped translation studies. Theo Hermans considers translation norms, equivalence, polysystems and social systems, covering a wide range of theorists in his discussion of the principles of translation studies. Reissued with a new foreword by Kathryn Batchelor, which updates the text for a new generation of readers, *Translation in Systems* endures partly on account of Hermans's vivid and articulate writing style. The book covers the fundamental problems of translation norms, equivalence, polysystems and social systems, encompassing not only the work of Levý, Holmes, Even-Zohar, Toury,

Lefevere, Lambert, Bassnett, D'hulst and others, but also giving special attention to contributions derived from Pierre Bourdieu and Niklas Luhmann. Hermans explains how contemporary descriptive approaches came about, what the basic ideas were, how those ideas have evolved over time, and offers a critique of these approaches. With practical questions of how to investigate translation (including problems of definition, description and assessment of readerships), this is essential reading for graduate students and researchers in translation studies and related areas.

Most design engineers are tasked to design against failure, and one of the biggest causes of product failure is failure of the material due to fatigue/fracture. From leading experts in fracture mechanics, this new text provides new approaches and new applications to advance the understanding of crack initiation and propagation. With applications in composite materials, layered

structures, and microelectronic packaging, among others, this timely coverage is an important resource for anyone studying or applying concepts of fracture mechanics. Concise and easily understood mathematical treatment of crack tip fields (chapter 3) provides the basis for applying fracture mechanics in solving practical problems. Unique coverage of bi-material interfacial cracks (chapter 8), with applications to commercially important areas of composite materials, layered structures, and microelectronic packaging. A full chapter (chapter 9) on the cohesive zone

model approach, which has been extensively used in recent years to simulate crack propagation. A unified discussion of fracture criteria involving nonlinear/plastic deformations

Vestibular System Part 1: Basic Mechanisms John Wiley & Sons For over a decade, Andrew "bunnie" Huang, one of the world's most esteemed hackers, has shaped the fields of hacking and hardware, from his cult-classic book Hacking the Xbox to the open-source laptop Novena and his mentorship of various hardware startups and developers. In The

Hardware Hacker, Huang shares his experiences in manufacturing and open hardware, creating an illuminating and compelling career retrospective. Huang ' s journey starts with his first visit to the staggering electronics markets in Shenzhen, with booths overflowing with capacitors, memory chips, voltmeters, and possibility. He shares how he navigated the overwhelming world of Chinese factories to bring chumby, Novena, and Chibitronics to life, covering everything from creating a Bill of Materials to choosing the factory to best fit his needs. Through this collection of personal essays and interviews on topics ranging from the legality of reverse engineering to a comparison of

intellectual property practices between China and the United States, bunnie weaves engineering, law, and society into the tapestry of open hardware. With highly detailed passages on the ins and outs of manufacturing and a comprehensive take on the issues associated with open source hardware, The Hardware Hacker is an invaluable resource for aspiring hackers and makers.

The details of the receptor mechanism are not yet fully understood for any sensory system. However, sufficient data are available (for the vestibular system and for other systems) to permit meaningful tracking of the sensory messages through the nervous system and via conscious experience. The

reception, processing, storage and output of information in man and other animals, as done by means of receptors, neurons, secretory cells and muscle fibers, are collectively referred to as mind. Sensory physiologists tend to disbelieve in extrasensory perception. Sensory physiology in general is an area upon which different sciences and methods converge. Anatomists, physiologists, psychologists, physicists, chemists, and engineers have made important contributions to sensory physiology. What is special about vestibular physiology is the fact that many research workers are clinicians, living under the constant pressure of their patient's demands. This is a disadvantage when it comes to writing handbooks, but an advantage for the patient, since research is guided by clinical practice and can be quickly applied.

Modern methods, such as recording from single nerve units and the correlation of electrophysiological and psychophysical data, have greatly contributed to our knowledge, yet the study of lesions is still important, especially in the vestibular field.

Engineering Ethics John Wiley & Sons
The ultimate guide to predicting winners and losers in high technology
Pip Coburn became famous for writing some of the liveliest reports on Wall Street. He quoted everyone from Machiavelli to HAL, Anaïs Nin to Yoda, Einstein to Gandhi. But along with the quirky writing, he consistently delivered sharp insights into technology trends and helped investors pick stocks with long-term potential. After years of studying

countless winners and losers, Coburn has come up with a simple idea that explains why some technologies become huge hits (iPods, DVD players, Netflix), but others never reach more than a tiny audience (Segways, video phones, tablet PCs). He says that people are only willing to change when the pain of their current situation outweighs the perceived pain of trying something new. In other words, technology demands a change in habits, and that ' s the leading cause of failure for countless cool inventions. Too many tech companies believe in "build it and they will come"— build something better and people will beat a path to your door. But, as Coburn shows, most potential users are afraid of new technologies, and they need a really great reason to change. The Change Function is an irreverent look at how this pattern plays out in countless sectors, from computers to cell phones to digital TV recorders. It will be an invaluable book for people who create and invest in new technologies.

This entertaining book seeks to unravel an array of pricing puzzles from the one captured in the book 's title to why so many prices end with "9" (as in \$2.99 or \$179). Along the way, the author explains how the 9/11 terrorists have, through the effects of their heinous acts on the relative prices of various modes of travel, killed more Americans since 9/11 than they killed that fateful day. He also explains how well-meaning efforts to spur the use of alternative, supposedly environmentally friendly fuels have starved millions of people around the world and given rise to the deforestation of rainforests in Malaysia and Indonesia.
