CatalogPublications MARTHA is a set of general-purpose programs for analyzing linear electrical networks. available to users with access to APL time-sharing systems. The programs analyze, as a function of frequency, most linear "transmissiontype" networks, with an input and an output. This

includes most filters, includes tow-port amplifiers, microwave networks, and feedback systems, even if such circuits are relatively complicated, with multiple feedback paths and branches. The programs cannot handle some complicated interconnections of components, and are not set up to analyze nonlinear or than one network time varying networks. The topology of the network is described using "wiring operators." The elements available include lumped and distributed, active and passive, reciprocal and nonreciprocal elements. The possible output

parameters (impedance, admittance, hybrid, scattering, and ABCD matrices), as others; ideal well as voltage gain, transformers; insertion gain, transducer gain, etc. These, their real or imaginary parts, or magnitude or phase, may be printed or plotted as functions of frequency or of each other. More can be analyzed simultaneously. MARTHA is not inherently better at one frequency range than another, except perhaps in its repertoire of elements and response functions. MARTHA includes. besides R, L, and C. sixteen controlled sources: operational

amplifiers; mutual inductance: three transistor models and the possibility of easily creating several composite pi and tee structures; and a few exotic elements such as gyrators. For high-frequency applications MARTHA has several microwave elements, including TEM transmission lines, waveguides, attenuators, and isolators. which is concerned with human anatomical, anthropometric, physiological and biomechanical characteristics as they relate to physical activity. Topics include working postures, materials handling, repetitive movements, work-related musculoskeletal disorders, workplace layout, safety, and health. Survey (USGS) Water Engineers Handbook Resources Discipline is CRC Press to provide the information and understanding needed for wise management of the Nation's water resources. Inherent in this mission is the responsibility of collecting data that accurately describe the physical, chemical, and biological attributes of water systems. These data are used for environmental and resource assessments by the USGS, other government agencies and scientific organizations, and the general public. Reliable geotechnical and quality-assured data are essential to the credibility and impartiality of the water-resources appraisals carried out by the USGS. Society of **Automotive**

Two-phase Flow Research Using the DC-9/KC-135 Apparatus Psychology Press More than ten years have passed since the first edition was published. During that period there have been a substantial number of changes in engineering, especially in the applications of foundation engineering. As the world population increases, more land is needed and many soil deposits previously deemed unsuitable for residential housing or

other construction projects are now being used. Such areas include problematic soil regions, mining subsidence areas, and sanitary landfills. To overcome the problems associated with these natural or man-made soil deposits, new and improved methods of analysis, design, and implementation are needed in foundation construction. As society develops and living standards rise, tall buildings, transportation facilities, and industrial complexes are increasingly being built. Because of the heavy design loads and the complicated environments, the traditional design concepts, construction materials, methods, and equipment also need improvement.

Further, recent energy and material shortages have caused additional burdens on the engineering profession and brought about the need to seek alternative or cost-saving methods for foundation design and construction. The Directory of Video, Multimedia & Audio-visual **Products CRC Press Optoelectronic** devices impact many areas of society, from simple household appliances and multimedia systems to communications. computing, spatial scanning, optical monitoring, 3D measurements and medical instruments. This is the most complete book about optoelectromechani

c systems and semiconductor optoelectronic devices; it provides an accessible, wellorganized overview of optoelectronic devices and properties that emphasizes basic principles. The Measurement. Instrumentation and Sensors Handbook Springer Science & **Business Media** This book presents a comprehensive description of the theory and physics of high-intensity ultrasound, as well as dealing with a wide range of problems associated with the industrial applications of ultrasound, mainly in the areas of metallurgy and mineral processing. The book is divided into three sections.

with Part I introducing metallurgy, for example scientists, designers, the reader to the theory ore dressing or and physics of highintensity ultrasound. Topics in this section include the propagation of ultrasound in liquid media and related nonlinear phenomena, treatment, welding, metal crystallization in an ultrasonic field. ultrasound propagation in solids, alterations in dislocational structure. and ultrasonic effects on solidified metal. In Part II the design of ultrasonic generators, mechanoacoustic radiators and other vibrational systems is considered, as well as the control of acoustic parameters when vibrations are passed into a processed medium. Part III describes problems associated with various uses of high-intensity ultrasound in

producing powders and cast composites. The applications of high-intensity ultrasound for metal shaping, thermal and thermochemical cutting, refining, and surface hardening are also discussed here. This comprehensive monograph provides an invaluable source of information, which has been largely unavailable in the West until now. The author is very well known and respected internationally within the field of ultrasonics. Motor Imported Car Repair Manual **US Naval Institute** Press This product is a concise and useful reference for industrial engineers,

managers, research personnel and students. It covers an extensive range of topics that encompass the subject of measurement, instrumentation, and sensors. The Measurement Instrumentation and Sensors Handbook on CD-ROM provides easy access to the instrumentation and techniques for practical measurements required in engineering, physics, chemistry, and the life sciences. A Brief Practical Guide to Eddy Covariance Flux Measurements CRC Press

This book was written **Ergonomics and** to familiarize beginners with general theoretical principles, requirements, applications, and processing steps of the Eddy Covariance method. It is intended to assist in further understanding the method, and provides references such as textbooks. network guidelines and journal papers. It is also intended to help students and researchers in field deployment of instruments used with the Eddy Covariance method. and to promote its use beyond micrometeorology. Advances in **Physical** 

**Human Factors:** Part I AHFE International (USA) The discipline of human factors and ergonomics (HF/E) is concerned with the design of products, process, services, and work systems to assure their productive, safe and satisfying use by people. Physical ergonomics involves the design of working environments to fit human physical abilities. By understanding the constraints and capabilities of the human body and mind, we can

design products, services and environments that are effective. reliable, safe and comfortable for everyday use. This book focuses on the advances in the physical HF/E, which are a critical aspect in the design of any humancentered technological system. The ideas and practical solutions described in the book are the outcome of dedicated research by academics and practitioners aiming to advance theory and practice in this dynamic and allencompassing discipline.
