This book presents the latest research findings, methods and development techniques related to Ubiquitous and Pervasive Computing (UPC) as well as challenges and solutions from both theoretical and

practical perspectives with an emphasis on
innovative, mobile and internet services. With the
proliferation of wireless technologies and
electronic devices, there is a rapidly growing
interest in Ubiquitous and Pervasive Computing
(UPC). UPC makes it possible to create a human-
oriented computing environment where computer chips
are embedded in everyday objects and interact with
physical world. It also allows users to be online
even while moving around, providing them with almost
permanent access to their preferred services. Along
with a great potential to revolutionize our lives,
UPC also poses new research challenges.

Ramifications of the convergence of sports and digital technology,
from athlete and spectator experience to the role of media

innovation at the Olympics. Digital technology is changing everything
about modern sports. Athletes and coaches rely on digital data to
monitor and enhance performance. Officials use tracking systems to
augment their judgment in what is an increasingly superhuman field
of play. Spectators tune in to live sports through social media, or even
through virtual reality. Audiences now act as citizen journalists whose
collective shared data expands the places in which we consume sports
news. In Sport 2.0, Andy Miah examines the convergence of sports
and digital cultures, examining not only how it affects our
participation in sport but also how it changes our experience of life
online. This convergence redefines how we think of about our
bodies, the social function of sports, and the kinds of people who are
playing. Miah describes a world in which the rise of competitive
computer game playing—e-sports—challenges and invigorates the
social mandate. Miah also looks at the Olympic Games as an
exemplar of digital innovation in sports, and offers a detailed look at
the social media footprint of the 2012 London Games, discussing
how organizers, sponsors, media, and activists responded to the
world's largest media event. In the end, Miah does not argue that
physical activity will cease to be central to sports, or that digital
corporeality will replace the nondigital version. Rather, he provides a
road map for how sports will become mixed-reality experiences and
abandon the duality of physical and digital.

Advances in Applied Mechanical Engineering John Wiley & Sons

The objective of this book is to assist scientists and engineers select the ideal material or manufacturing process for particular applications;

these could cover a wide range of fields, from light-weight structures to electronic hardware. The book will help in problem solving as it also presents more than 100 case studies and failure investigations from the space sector that can, by analogy, be applied to other industries. Difficult-to-find material data is included for reference. The sciences of metallic (primarily) and organic materials presented throughout the book demonstrate how they can be applied as an integral part of spacecraft product assurance schemes, which involve quality, material and processes evaluations, and the selection of mechanical and component parts. In this successor edition, which has been revised and updated, engineering problems associated with critical spacecraft hardware and the space environment are highlighted by over 500 illustrations including micrographs and fractographs. Space hardware captured by astronauts and returned to Earth from long durations in space are examined. Information detailed in the Handbook is applicable to general terrestrial applications including consumer electronics as well as high reliability systems associated with aeronautics, medical equipment and ground transportation. This Handbook is also directed to those involved in maximizing the relia bility of new materials and processes for space technology and space engineering. It will be invaluable to engineers concerned with the construction of advanced structures or mechanical and electronic sub-systems.
