Architectural Transformations in Network Services and Distributed Systems CRC Press

Founded in San Francisco in 2009, Square finished 2012 as the darling of Silicon Valley; flush with more than \$340 million in funding, the firm had grown to several hundred employees in just three short years. It processed more than \$10 billion annually in credit and debit card payments from small business owners that used Square's smartphone-enabled card swipe device wherever cellular or wireless Internet service was available. However, Square's success had attracted new entrants into the mobile payments processing space, both in the United States and abroad, threatening to derail the company's remarkable trajectory. With its latest financing round valuing the company in excess of \$3.4 billion, management and investors were considering which strategies would continue--even accelerate--the company's growth Square presents an opportunity for classes in strategy and technology management to contemplate the following: -How can a startup disrupt an established set of incumbents without provoking a harsh competitive response? -How can a growth company in a rapidly changing industry expand beyond the core competency that fueled its initial growth? -Which growth platforms make the most sense for a company in a complicated ecosystem with many players offering divergent solutions?

This publication identifies the role of digital infrastructure in achieving the Sustainable Development Goals (SDGs)--including education, employment, agricultural sustainability, food security, and spatial inequality--in 12 countries in Latin America and the Caribbean. It identifies a gap between the outcomes achieved for each SDG in the countries studied and those achieved in OECD countries. Moreover, the region still has a long way to go to achieve the SDG targets set in the 2030 Agenda for Sustainable Development. The authors explain how investment in digital infrastructure can help close the gaps between the region and these two benchmarks (OECD countries and SDG targets). They also quantify the investment in telecom in the region between 2008 and 2017 and estimate what amount is still needed to help close these gaps.

Programming the Mobile Web Pearson Education (Us)

Written by an industry insider with state of the art research at their fingertips, this book describes the Radio Access Network (RAN) architecture, starting with currently deployed 4G, followed by the description of 5G requirements and why re-thinking of the RAN architecture is needed to support these. Based on these considerations, it explains how 5G network architecture, which is currently being defined, is likely to evolve. The aim is not merely to cover relevant standards and technologies as a purely academic exercise (although a significant part of the book will be dedicated to these), but to augment these by practical deployment, to illustrate why the RAN architecture is changing and where it is going. With 5G deployments on the horizon, there is a desire within companies to both re-think the RAN architecture and to change the proprietary nature of the RAN. Correspondingly, there is increased interest in academia, standards bodies and commercial entities involved in the area.
