The introduction of consumer-level head-mounted devices (HMDs) has led to a major drop in the application costs of virtual reality (VR), making the technology available for a wide range of users. To understand if VR HMDs can be used for planning and training in the context of manual order picking, this thesis provides the results of a large-scale randomized controlled study in which order picking has been compared between a virtual and a real environment. The results imply that VR HMDs can indeed be used by manufacturers and warehouse operators in a rack planning process if the reduction of searching times or the perceived workload is in focus.

Additionally, the findings enable the use of VR HMDs for scientific research on human-centred rack design. Finally, the thesis highlights the usability of VR HMDs for training manual order picking activities.

This proceedings book comprises the latest achievements in research and development in educational robotics presented at the 11th International Conference on Robotics in Education (RiE), which was carried out as a purely virtual conference from September 30 to October 2, 2020. Researchers and educators will find valuable methodologies and tools for robotics in education that encourage learning in the fields of science,

technology, engineering, arts and mathematics (STEAM) through the design, creation and programming of tangible artifacts for creating personally meaningful objects and addressing real-world societal needs. This also involves the introduction of technologies ranging from robotics platforms to programming environments and languages. Evaluation results prove the impact of robotics on the students' interests and competence development. The presented approaches cover the whole educative range from elementary school to university in both formal as well as informal settings.
