Children are already learning at birth, and they develop and learn at a rapid pace in their early years. This provides a critical foundation for lifelong progress, and the adults who provide for the care and the education of young children bear a great responsibility for their health, development, and learning. Despite the fact that they share the same objective - to nurture young children and secure their future success - the various practitioners who contribute to the care and the education of children from birth through age 8 are not acknowledged as a workforce unified by the common knowledge and competencies needed to do their jobs well. Transforming the Workforce for Children Birth Through Age 8 explores the science of child development, particularly looking at implications for the professionals who work with children. This report examines the current capacities and practices of the workforce, the settings in which they work, the policies and infrastructure that set qualifications and provide professional learning, and the government agencies and other funders who support and oversee these systems. This book then makes recommendations to improve the quality of professional practice and the practice environment for care and education professionals. These detailed recommendations create a blueprint for action that builds on a unifying foundation of child development and early learning, shared knowledge and competencies for care and education professionals, and principles for effective professional learning. Young children thrive and learn best when they have secure, positive relationships with adults who are knowledgeable about how to support their development and learning and are responsive to their individual progress. Transforming the Workforce for Children Birth Through Age 8 offers guidance on system changes to improve the quality of professional practice, specific actions to improve professional learning systems and workforce development, and research to continue to build the knowledge base in ways that will directly advance and inform future actions. The recommendations of this book provide an opportunity to improve the quality of the care and the education that children receive, and ultimately improve outcomes for children.

Intended for courses on theories of human development, this new text presents nine theories grouped into three major families - those that emphasize biological systems; those that emphasize environmental factors; and those that emphasize a dynamic interaction between biological and environmental forces. The nine theories selected have a long and productive history in human development and continue to evolve as a result of new insights. The inclusion of social role theory and life course theory expand the book's relevance to the study of adulthood and aging. Grouping the theories by families enhances students' ability to think critically about theoretical ideas, assess the strengths and weaknesses of each theory, and gain a deeper understanding of how each theory guides research and application. The three families are introduced with a brief overview of the unique perspectives of each theory and the rationale for grouping these theories together. Discussion of each theory includes: the historical and cultural context in which the theory was developed; an overview of key concepts and important ideas; new directions in contemporary scientific work; a research example illustrating how the theory has been tested and modified; an application showing how the theory has guided the design of an intervention or program; an analysis of how the theory answers basic questions about human development; and a critique highlighting the theories' strengths and weaknesses. Theories of Human Development serves as a text in advanced undergraduate and/or beginning graduate courses in theories of human development. Its clear organization and engaging writing style make it accessible to students with a minimal background in human development.

K. Warner Schaie I am pleased to write a foreword for this interesting volume, particularly as over many years, I have had the privilege of interacting with the editors and a majority of the contributors in various professional roles as a colleague, mentor, or research collaborator. The editors begin their introduction by asking why one would want to read yet another book on human development. They immediately answer their question by pointing out that many developmentally oriented texts and other treatises neglect the theoretical foundations of human development and fail to embed psychological constructs within the multidisciplinary context so essential to understanding development. This volume provides a positive remedy to past deficiencies in volumes on human development with a well-organized structure that leads the reader from a general introduction through the basic processes to methodological issues and the relation of developmental constructs to social context and biological infrastructure. This approach does not surprise. After all, the editors and most of the contributors at one time or another had a connection to the Max Planck Institute of Human Development in Berlin, whether as students, junior scientists, or senior visitors. That institute, under the leadership of Paul Baltes, has been instrumental in pursuing a systematic lifespan approach to the study of cognition and personality. Over the past two decades, it has influenced the careers of a generation of scientists who have advocated long-term studies of human development in an interdisciplinary context.
