I changed it from 15K to 470. Not from 15K to 4.7K. I think the issue was that the circuit works over 500-10Kohm range on the multiturn pot. A 15K resistor in series with that would make it ~15k-22K range instead, so turning the pot makes no difference it is always at its lowest voltage.

I picked up a HYelec HY3005D power supply and need to modify it. The current limit won't go lower than 150ma. The current limit latches up on a short. This appears to be a known issue...I just wanna fix it. A schematic would be far less effort than reverse engineering it. I've found almost zero info on this supply on the web. hades.mech.northwestern.edu
