In 1772 in Uppsala the Swedish chemist Karl Wilhelm Scheele discovered the element Oxygen. Two hundred and one years later, in 1973, the International Society on Oxygen Transport to Tissue (ISOTT) was founded. Since then there has been an annual ISOTT meeting. After 24 years of international ISOTT meetings it was decided, at the 2005 summit in Bary, Italy, that the 2007 meeting was to be held in Uppsala, Sweden. Thus, after the Louisville meeting we, in the Uppsala group, withdrew to the Edgewater Resort at Taylorsville Lake outside Louisville and prepared the Uppsala ISOTT meeting by tasting Kentucky Bourbons, smoking cigars while bathing in a jacuzzi in the hot dark Kentucky night full of fire flies and a sky full of stars. The ISOTT program should include different aspects of oxygen - however, it is accepted that each meeting has its own local "touch". We decided to focus the Uppsala ISOTT meeting on the theme of "Imaging and measuring oxygen changes". With this in mind we invited scientists within and outside the ISOTT society. We then also received lots of good abstracts from ISOTT members that were included in the program. Lars-Olof Sundelöf introduction speech "AIR AND FIRE" concerned how oxygen was discovered in Uppsala in 1772 by Karl Wilhelm Scheele. After the introduction speech a get together event took place in the magnificent and spacious foyer of Uppsala University main building. The vice chancellor Ulf Pettersson welcomed all delegates to Sweden and Uppsala.

This book contains the papers delivered at the Fourth International Symposium on Intracranial Pressure, held at Williamsburg, Virginia, USA, June 10-14, 1979. Divided into 12 sessions, they reflect the most recent developments in areas such as head injuries, pressure volume studies, cerebrovascular complications, intracranial hemorrhage, brain edema, systemic factors and infectious processes, data recording and analysis, CSF formation and absorption, hydrocephalus, clinical aspects of ICP monitoring, anesthesia and intracranial pressure, treatment with barbiturates and steroids, and osmotherapy. The book concludes with a summary of the present state-of-the-art in the field as a whole by Dr. Langfitt. There were two innovations at this Symposium. The first of these was poster sessions, the second, breakfast seminars. This volume contains all papers read plus all those presented as posters, and for this reason contains more pages than the three previous volumes. The organizers wish to thank the Advisory Committee for the work done in paper selection and focus of the Conference. Appreciation is also given to the Chairmen and Co-chairmen of the sessions for the preparation of summary statements. Manuscript preparation was performed by Ms. Lucille Browne, and gratitude is expressed to her. The next Symposium, the Fifth International Conference on ICP, will be held in Japan in 1982. We also wish to acknowledge the technical help of Springer-Verlag and their celerity in producing this volume. The Editors VII Contents Session I. Head Injury Chairman: D. P. BECKER; Co-chairman: I. Implantable pressure sensing devices have the potential to improve patient management and treatment outcomes in a wide variety of conditions, including monitoring intracranial pressure (ICP) in hydrocephalus patients. The intracranial pressure application requires a long-term implantable device with high accuracy, resolute stability, a rechargeable power supply and must not exclude hydrocephalus patients from existing diagnostic medical procedures - namely medical imaging. ICP is the gold-standard indicator for patient health in the hydrocephalus condition, where the accumulation of cerebrospinal fluid in the ventricles of the brain leads to an increase of ICP. Current treatment involves implanting a shunt to redirect the excess fluid, however shunt failure rates are high (up to 40% in the first year of implantation) and difficult to diagnose. Standard diagnostic procedures require costly medical imaging of ventricle size followed by burr-hole surgery to insert an acute transcutaneous lead ICP sensor into the brain parenchyma. In this thesis the feasibility of a lifetime fully implantable ICP measuring device is investigated. Such a device will comprise of a pressure sensing catheter (where the sensor is implanted in the parenchyma), connected to an electrical unit outside the skull, under the skin. The unit contains signal conditioning circuitry, wireless communication antenna, and an inductive power pickup coil allowing the implant to sit dormant until interrogated by an external reader wand. This thesis reports on the clinical compatibility of a pressure monitoring system. Pressure measurement stability over time has been a major cause of failure for previous attempts at a long term ICP device, and this research has shown some (but not all) pressure sensors do have adequate stability over one year of operation within a model of the challenging environment of full implantation. An implantable device was tested in animal in-vivo experimentation including using the high fidelity sensor to make accurate recordings of rat LVP, and validating the device's ability to measure ICP in acute large animal experiments. MRI compatibility was investigated for the device, including the development and validation of numerical models for RF heating analysis to guide prototype design. It is concluded that the implantable pressure sensing device has the potential to perform in the clinical environment, by screening for pressure sensor performance and avoiding critical lengths of the sensor catheter to limit patient risk in the MRI.

The guide arose from a survey of UK users and manufacturers/developers to assess detector equipment usage and calibration, in order to identify the factors influencing the accuracy of measurements obtained with detector array equipment, and thus develop calibration techniques and establish best practice procedures. The text contains both a review of the existing literature and a large amount of new experimental data obtained during the course of the study. The main emphasis has been on UV, visible, and near-infrared systems that use silicon detector technology, but the issues arising in thermal imaging with infrared detector arrays have also been addressed, along with brief sections on EM CCDs for low-light-level imaging and on lag effects in CMOS active pixel sensors.
