NIST SP 1800-9C Draft August 2017 Managing user access in a fast-moving industry such as the financial services sector requires frequent changes to user identity and role information and to user access profiles for systems and data. Employees using these various ARM systems may lack methods to coordinate access across the corporation effectively to ensure that ARM changes are executed consistently throughout the enterprise. This inconsistency is inefficient and can result in security risks.The NIST Cybersecurity Practice Guide shows IT professionals and security engineers how we implemented this example solution. In Volume C we cover all the products employed in the reference design. We do not re-create the product manufacturers'' documentation, which is presumed to be widely available. Rather, these guides show how we incorporated the products together in our environment. Why buy a book you can download for free? First you gotta find a good clean (legible) copy and make sure it''s the latest version (not always easy). Some documents found on the web are missing some pages or the image quality is so poor, they are difficult to read. We look over each document carefully and replace poor quality images by going back to the original source document. We proof each document to make sure it''s all there - including all changes. If you find a good copy, you could print it using a network printer you share with 100 other people (typically its either out of paper or toner). If it''s just a 10-page document, no problem, but if it''s 250-pages, you will need to punch 3 holes in all those pages and put it in a 3-ring binder. Takes at least an hour. It''s much more cost-effective to just order the latest version from Amazon.com This book is published by 4th Watch Books and includes copyright material. We publish compact, tightly-bound, full-size books (8 by 11 inches), with glossy covers. 4th Watch Books is a Service Disabled Veteran-Owned Small Business (SDVOSB). An award-winning scientist offers his unorthodox approach to childrearing: "Parentology is brilliant, jaw-droppingly funny, and full of wisdom…bound to change your thinking about parenting and its conventions" (Amy Chua, author of Battle Hymn of the Tiger Mother). If you're like many parents, you might ask family and friends for advice when faced with important choices about how to raise your kids. You might turn to parenting books or simply rely on timeworn religious or cultural traditions. But when Dalton Conley, a dual-doctorate scientist and full-blown nerd, needed childrearing advice, he turned to scientific research to make the big decisions. In Parentology, Conley hilariously reports the results of those experiments, from bribing his kids to do math (since studies show conditional cash transfers improved educational and health outcomes for kids) to teaching them impulse control by giving them weird names (because evidence shows kids with unique names learn not to react when their peers tease them) to getting a vasectomy (because fewer kids in a family mean smarter kids). Conley encourages parents to draw on the latest data to rear children, if only because that level of engagement with kids will produce solid and happy ones. Ultimately these experiments are very loving, and the outcomes are redemptive—even when Conley's sassy kids show him the limits of his profession. Parentology teaches you everything you need to know about the latest literature on parenting—with lessons that go down easy. You'll be laughing and learning at the same time.

The National Disaster Housing Strategy (the Strategy) serves two purposes. First, it describes how we as a Nation currently provide housing to those affected by disasters. It summarizes, for the first time in a single document, the many sheltering and housing efforts we have in the United States and the broad array of organizations that are involved in managing these programs. The Strategy also outlines the key principles and policies that guide the disaster housing process. Second, and more importantly, the

Strategy charts the new direction that our disaster housing efforts must take if we are to better meet the emergent needs of disaster victims and communities. Today we face a wider range of hazards and potentially catastrophic events than we have ever faced before. These include terrorist attacks and major natural disasters that could destroy large sections of the Nation's infrastructure. This new direction must address the disaster housing implications of all these risks and hazards and, at the same time, guide development of essential, baseline capabilities to overcome existing limitations. The new direction for disaster housing must leverage emerging technologies and new approaches in building design to provide an array of housing options. It must also be cost effective and draw on lessons learned and best practices. Above all, this new direction must institutionalize genuine collaboration and cooperation among the various local, State, tribal, and Federal partners, nongovernmental organizations, and the private sector to meet the needs of all disaster victims. Current practices in disaster housing vary based on the nature and scope of a disaster and can range from providing short-term shelters to arranging temporary and, in some cases, permanent housing. Establishing emergency shelters is generally a well-choreographed effort that unfolds smoothly at the local level as emergency management officials and nongovernmental organizations execute their emergency plans. The challenges increase when disaster victims are displaced from their homes for longer periods of time and temporary housing must be provided. The process of meeting individual and household needs becomes more challenging, and the responsibilities and roles of those involved must be absolutely clear. States monitor and support local government efforts and activate their capabilities as needed to augment local capabilities. The Federal Government stands alongside the States as an engaged partner, maintaining disaster housing resources and ready to deploy those resources, if required, to fill any emerging gap. While this process generally works very well, it broke down in August 2005 when Hurricane Katrina struck the coast of Louisiana and Mississippi and overwhelmed the capabilities of responders at all jurisdictional levels. And now, more than 3 years after Hurricane Katrina, we are still wrestling with many technical and policy issues related to disaster housing that Katrina brought to light. This Strategy outlines a vision, supported by specific goals, that will point the Nation in a new direction to meet the disaster housing needs of individuals and communities.

Patient information is interspersed with questions and answers suitable for self-study or group discussion and a pharmaceutical care plan is included within each chapter. The cases included address situations which are commonly encountered or associated with particular difficulties in treatment individualisation. Those in which major advances in therapeutics have recently occurred are also covered. All case studies from the previous edition have been updated and revised, and new chapters have been included on the following: eczema; psoriasis; Crohn's disease; oncology; substance misuse.

Simulation-Based Optimization: Parametric Optimization Techniques and Reinforcement Learning introduce the evolving area of static and dynamic simulation-based optimization. Covered in detail are model-free optimization techniques – especially designed for those discrete-event, stochastic systems which can be simulated but whose analytical models are difficult to find in closed mathematical forms. Key features of this revised and improved Second Edition include: · Extensive coverage, via step-by-step recipes, of powerful new algorithms for static simulation optimization, including simultaneous perturbation, backtracking adaptive search and nested partitions, in addition to traditional methods, such as response surfaces, Nelder-Mead search and meta-heuristics (simulated annealing, tabu search, and genetic algorithms) · Detailed coverage of the Bellman equation framework for Markov Decision Processes (MDPs), along with dynamic programming (value and policy iteration) for discounted, average, and total reward performance metrics · An in-depth consideration of dynamic simulation optimization via temporal differences and Reinforcement Learning: Q-Learning, SARSA, and R-SMART algorithms, and policy search, via API, Q-P-Learning, actor-critics, and learning automata · A special examination of neural-network-based function approximation for Reinforcement Learning, semi-Markov decision processes (SMDPs), finite-horizon problems, two time scales, case studies for industrial tasks, computer codes (placed online) and convergence proofs, via Banach fixed point theory and Ordinary Differential Equations Themed around three areas in separate sets of chapters – Static Simulation Optimization, Reinforcement Learning and Convergence Analysis – this book is written for researchers and students in the fields of engineering (industrial, systems, electrical and computer), operations research, computer science and applied mathematics.

This book treats the central physical concepts and mathematical techniques used to investigate the dynamics of open quantum systems. To provide a self-contained presentation the text begins with a survey of classical probability theory and with an introduction into the foundations of quantum mechanics with particular emphasis on its statistical interpretation. The fundamentals of density matrix theory, quantum Markov processes and dynamical semigroups are developed. The most important master equations used in quantum optics and in the theory of quantum Brownian motion are applied to the study of many examples. Special attention is paid to the theory of environment induced decoherence, its role in the dynamical description of the measurement process and to the experimental observation of decohering Schrodinger cat states. The book includes the modern formulation of open quantum systems in terms of stochastic processes in Hilbert space. Stochastic wave function methods and Monte Carlo algorithms are designed and applied to important examples from quantum optics and atomic physics, such as Levy statistics in the laser cooling of atoms, and the damped Jaynes-Cummings model. The basic features of the non-Markovian quantum behaviour of open systems are examined on the basis of projection operator techniques. In addition, the book expounds the relativistic theory of quantum measurements and discusses several examples from a unified perspective, e.g. non-local measurements and quantum teleportation. Influence functional and super-operator techniques are employed to study the density matrix theory in quantum electrodynamics and applications to the destruction of quantum coherence are presented. The text addresses graduate students and lecturers in physics and applied mathematics, as well as researchers with interests in fundamental questions in quantum mechanics and its applications. Many analytical methods and computer simulation techniques are developed and illustrated with the help of numerous specific examples. Only a basic understanding of quantum mechanics and of elementary concepts of probability theory is assumed.

Across the United States, thousands of hazardous waste sites are contaminated with chemicals that prevent the underlying groundwater from meeting drinking water standards. These include Superfund sites and other facilities that handle and dispose of hazardous waste, active and inactive dry cleaners, and leaking underground storage tanks; many are at federal facilities such as military installations. While many sites have been closed over the past 30 years through cleanup programs run by the U.S. Department of Defense, the U.S. EPA, and other state and federal agencies, the remaining caseload is much more difficult to address because the nature of the contamination and subsurface conditions make it difficult to achieve drinking water standards in the affected groundwater. Alternatives for Managing the Nation's Complex Contaminated Groundwater Sites estimates that at least 126,000 sites across the U.S. still have contaminated groundwater, and their closure is expected to cost at least $110 billion to $127 billion. About 10 percent of these sites are considered "complex," meaning restoration is unlikely to be achieved in the next 50 to 100 years due to technological limitations. At sites where contaminant concentrations have plateaued at levels above cleanup goals despite active efforts, the report recommends evaluating whether the sites should transition to long-term management, where risks would be monitored and harmful exposures prevented, but at reduced costs.

Differential Equations for Scientists and Engineers is a book designed with students in mind. It attempts to take a concise, simple, and no-frills approach to differential equations. The approach used in this text is to give students extensive experience in main solution techniques with a lighter emphasis on the physical interpretation of the results. With a more manageable page count than comparable titles, and over 400 exercises that can be solved without a calculating device, this book emphasizes the understanding and practice of essential topics in a succinct fashion. At the end of each worked example, the author provides the Mathematica commands that can be used to check the results and where applicable, to generate graphical representations. It can be used independently by the average student, while those continuing with the subject will develop a fundamental framework with which to pursue more advanced material. This book is designed for undergraduate students with some basic knowledge of precalculus algebra and a first course in calculus.
