The ideal gas law can be used in stoichiometry problems in which chemical reactions involve gases. Standard temperature and pressure (STP) are a useful set of benchmark

conditions to compare other properties of gases. At STP, gases have a volume of 22.4 L per mole. The ideal gas law can be used to determine densities of gases.

In addition, mass and molecular weight will give us moles. It appears that the ideal gas law is called for. However, there is a problem. We are being asked to change the conditions to a new amount of moles and pressure. So, it seems like the ideal gas law needs to be used twice. 2)

Problem #13: Calculate the volume 3.00 moles of a gas will occupy at 24.0 °C and 762.4 mm Hg. Solution:

Rearrange the Ideal Gas Law to this: $V = nRT / P$. Substitute values into the equation: $V = [(3.00 \text{ mol}) (0.08206 \text{ L atm mol}^{-1} \text{ K}^{-1}) (297.0 \text{ K})] / (762.4 \text{ mmHg} / 760.0 \text{ mmHg atm}^{-1})$ Note the conversion from mmHg to atm in the denominator.

There are in fact many different forms of the equation of state. Since the ideal gas law neglects both molecular size and inter molecular attractions, it is most accurate for monatomic gases at high temperatures and low pressures. The neglect of molecular size becomes less important for lower densities, i.e. for larger volumes at lower pressures, because the average distance between adjacent molecules becomes much larger than the molecular size.

Ideal gas molecules themselves take up no volume. The gas takes up volume since the molecules expand into a large region of space, but the Ideal gas molecules are approximated as point particles that have no volume in and of themselves. If this sounds too ideal to be true, you're right.

Ideal Gas Law Example Problem - Science Notes and Projects

The ideal gas law is an equation of state that describes the behavior of an ideal gas and also a real gas under conditions of ordinary temperature and low pressure. This is one of the most useful gas laws to know because it can be used to find pressure, volume, number of moles, or temperature of a gas. The formula for the ideal gas law is: $PV = nRT$. $P =$ pressure.

What is the ideal gas law?

(article) | Khan Academy

The ideal gas law relates the pressure, volume, quantity, and temperature of an ideal gas. At ordinary temperatures, you can use the ideal gas law to approximate the behavior of real gases. Here are examples of how to use the ideal gas law. You may wish to refer to the general properties of gases to review concepts and formulae related to ideal gasses.

Answer. As temperature of a gas increases, pressure will also increase based on the ideal gas law. The volume of

the tire can only expand so much before the rubber gives and releases the build up of pressure.

Ideal gas law – problems and solutions. 1. Ideal gases in a closed container initially have volume V and temperature T . The final temperature is $5/4T$ and the final pressure is $2P$. What is the final volume of the gas? Known : Initial volume (V_1) = V . Initial temperature (T_1) = T . Final temperature (T_2) = $5/4 T$. Initial pressure (P_1) = P . Final pressure (P_2) = $2P$
