This second edition of the classic textbook has been written to provide a completely up-to-date text for students of mechanical, industrial, manufacturing and production engineering, and is an indispensable reference for professional industrial engineers and managers. In his outstanding book, Professor Katsundo Hitomi integrates

three key themes into the text: *

manufacturing technology *

production management *

industrial economics

Manufacturing technology is concerned with the flow of materials from the acquisition of raw materials, through conversion in the workshop to the shipping of finished goods to the customer. Production management deals with the flow of information, by which the flow of materials is managed efficiently, through planning and control techniques.

Industrial economics focuses on the flow of production costs, aiming to minimise these to facilitate competitive pricing.

Professor Hitomi argues that the fundamental purpose of manufacturing is to create tangible goods, and it has a tradition dating back to the prehistoric toolmakers. The fundamental importance of manufacturing is that it facilitates basic existence, it creates wealth, and it contributes

to human happiness - manufacturing matters. Nowadays we regard manufacturing as operating in these other contexts, beyond the technological. It is in this unique synthesis that Professor Hitomi's study constitutes a new discipline: manufacturing systems engineering - a system that will promote manufacturing excellence. Key Features: * The classic textbook in manufacturing engineering * Fully revised edition providing a modern introduction to manufacturing technology, production management and industrial economics * Includes review questions and problems for the student reader

The 400 plus pages of this book present: Seven chapters on Industrial Engineering. Theory, practice, application; how it all fits together, payback of 10 times and how to get it, a sample charter. Four chapters on industrial engineering within a broader management structure; labor, materials, overhead, risk management. Eleven chapters on Cost Reduction; Survive, Recover, or Thrive. Basics, management, accounting, cherry pick, beyond cherry

picking, do operating practices interfere, value added, motivation. Thirteen chapters on Work Measurement. What, Why, and How-To. Measurement techniques, incentives, time study, work sampling, construction piece rates, a model plan to establish work measurement, methods checklists, glossary, useful forms. Twenty seven chapters on Plant layout, facility design, floor planning. Benefits, concepts, work flow and productivity, sequence, relocation, relationships between elements of a layout, master plan, many tools to use, glossary. Sixteen chapters on Facility Relocation, Merger, and Consolidation. A plant instead of or in addition to, is it time to expand? to relocate? Justification, the relocation marketplace, incentives and taxes, site search, confidentiality, sequence. Examples of layouts within different building shapes. Five chapters on Capacity,

Utilization, Constraints.

Determine constraints, manage them, optimize capacity. Four chapters on Lean, or the Toyota Production System (although the author does not claim to be an expert). Lean Manufacturing and its predecessors, Just In Time or Just In Case, What the real Lean experts say, push or pull supply chain. A chapter, Made in (the name of your country here). Good reasons to keep manufacturing near the home market. For management and for the practitioner, IE Theory, Practice and Application presents what, why, benefits to expect, how to manage and how to practice the discipline; with checklists; and forms. Practical, real-life actions, on the production floor but also from the boardroom, are suggested to support business and production management, productivity and capacity. IE tools do not all perform the same function. Furthermore, none of these tools is

automatically valuable or useful; each has pros and cons as you consider potential cost and benefit in your circumstance. Select those actions that will bring the most benefit to your circumstances and objectives and which can be implemented by your organization. "Most benefit" often refers to cost but not always; targets may in your situation include output volume now or future growth, fast reaction time, customer service, new products, new technology, quality, technical innovation or excellence, market share. IE tools can help attain all of these objectives.

Industrial Engineering and Management New Age International

This volume presents controlling tools for management in order to be in a position to communicate with control engineers concerning technological decisions. The main objective of manufacturing management is to make

profit. However, in traditional manufacturing systems none of the separate stages in the process support this objective. Management is not expert in any of these stages and therefore is dependent on specific experts at each stage and must follow their decisions. Each stage has its own first priority which is not profit and cost. This means that management does not have real control over these functional stages, nor over the process as a whole. This book presents controlling tools for management in order to allow them to communicate better with the experts of the particular manufacturing stages to reach better results and higher profits. It is shown that most enterprises can improve their efficiency rate by between 25 and 60% by using the tools developed here.

Industrial Engineering Routledge
