National Strategy for the COVID-19 Response and Pandemic Preparedness Cambridge University Press

National Center for Emerging and Zoonotic Infectious Diseases: Our Work, Our Stories 2011-2012 serves several purposes. First, it highlights major accomplishments from fiscal years 2011 and 2012 (October 1, 2010-September 30, 2012). NCEZID is CDC's newest national center, created during the organizational improvement initiative of

2009-2010. One of our overarching principles is to be transparent and accountable, and this first report (known by the shorter title NCEZID: Our Work, Our Stories 2011-2012) signals that we are committed to providing regular updates about our progress in protecting people from emerging and zoonotic infectious diseases. And finally, NCEZID: Our Work, Our Stories 2011-2012 places NCEZID's accomplishments in the context of the larger public health missions of CDC and the Office of Infectious Diseases. NCEZID's work overall directly reflects current CDC priorities to strengthen surveillance and epidemiology, enhance the agency's ability to support state and local public health, provide leadership in global health, promote effective public health policy, and address the leading causes of death, illness, and disability. And, as home to two of seven of CDC's domestic "winnable battles" (healthcare-associated infections and food safety), NCEZID is developing scalable strategies that will have a measurable and significant impact on public health. NCEZID: Our Work, Our Stories 2011-2012 also shows how NCEZID priorities and achievements align with the principles guiding all infectious disease work throughout the agency, as described in A CDC Framework for Preventing Infectious Diseases: Sustaining the Essentials and Innovating for the Future. And, lastly, the review of achievements of the past 2 years helped inform the direction for the Center's future work, as outlined in the newly released National Center for Emerging and Zoonotic Infectious Diseases Strategic Plan, 2012-2017. The prevention and control of emerging and zoonotic infectious diseases is arduous work, but we have made great strides since the fall of 2010. To provide a context for better understanding the significance of these accomplishments, this report begins with a section identifying NCEZID's core value to CDC and public health overall. Our many roles delineates the parts of the broader agency infectious disease mission that NCEZID is responsible for making happen-responding to outbreaks, managing world-class laboratories, ensuring public health preparedness, overseeing a unique portfolio of global activities, and investigating how diseases from animals are spread to people. These roles direct action on a variety of fronts. Taking action details the Center's work that focuses on healthcare-associated infections, antimicrobial resistance, foodborne disease and food safety, vector-borne diseases, high-consequence pathogens, global quarantine and migration, and waterborne disease and water safety. Most, but not all, of the Center's work falls within one of these areas. Absence from this report, however, does not signify lack of importance. NCEZID: Our Work, Our Stories 2011-2012 is not a comprehensive summary of all Center activities of the past 2 years. Limited space dictates that it is more

like a highlight reel of our most notable accomplishments.

Case Studies in Infectious Disease Springer Nature

Infectious diseases remain a leading cause of prolonged illness, premature mortality, and soaring health costs. In the United States in 1995, infectious diseases were the third leading cause of death, right behind heart disease and cancer. Mortality is mounting over time, owing to HIV/AIDS, pneumonia, and septicemia, with drug resistance playing an ever-increasing role in each of these disease categories. This book, a report from a Forum on Emerging Infections workshop, focuses on product areas where returns from the market might be perceived as being too small or too complicated by other factors to compete in industrial portfolios with other demands for investment. Vaccines are quintessential examples of such products. The lessons learned fall into four areas, including what makes intersectoral collaboration a reality, the notion of a product life cycle, the implications of divergent sectoral mandates and concepts of risk, and the roles of advocacy and public education. The summary contains an examination of the Children's Vaccine Initiative and other models, an industry perspective on the emerging infections agenda, and legal and regulatory issues.

Climate Change, Public Health, and the Law Introduction to Clinical Infectious Diseases

Scores of talented and dedicated people serve the forensic science community, performing vitally important work. However, they are often constrained by lack of adequate resources, sound policies, and national support. It is clear that change and advancements, both systematic and scientific, are needed in a number of forensic science disciplines to ensure the reliability of work, establish enforceable standards, and promote best practices with consistent application. *Strengthening Forensic Science in the United States: A Path Forward* provides a detailed plan for addressing these needs and suggests the creation of a new government entity, the National Institute of Forensic Science, to establish and enforce standards within the forensic science community. The benefits of improving and regulating the forensic science disciplines are clear: assisting law enforcement officials, enhancing homeland security, and reducing the risk of wrongful conviction and exoneration. *Strengthening Forensic Science in the United States* gives a full account of what is needed to advance the forensic science disciplines, including upgrading of systems and organizational structures, better training, widespread adoption of uniform and enforceable best practices, and mandatory certification and accreditation programs. While this book provides an essential call-to-action for congress and policy makers, it also serves as a vital tool for law enforcement agencies, criminal prosecutors and attorneys, and forensic science educators.

Since the 2014 Ebola outbreak many public- and private-sector leaders have seen a need for improved management of global public health emergencies. The effects of the Ebola epidemic go well beyond the three hardest-hit countries and beyond the health sector. Education, child protection, commerce, transportation, and human rights have all suffered. The consequences and lethality of Ebola have increased interest in coordinated global response to infectious threats, many of which could disrupt global health and commerce far more than the recent outbreak. In order to explore the potential for improving international management and response to outbreaks the National Academy of Medicine agreed to manage an international, independent, evidence-based, authoritative, multistakeholder expert commission. As part of this effort, the Institute of Medicine convened four workshops in summer of 2015. This commission report considers the evidence supplied by these workshops and offers conclusions and actionable recommendations to guide policy makers, international funders, civil society organizations, and the private sector.

The emergence of severe acute respiratory syndrome (SARS) in late 2002 and 2003 challenged the global public health community to confront a novel epidemic that spread rapidly from its origins in southern China until it had reached more than 25 other countries within a matter of months. In addition to the number of patients infected with the SARS virus, the disease had profound economic and political repercussions in many of the affected regions. Recent reports of isolated new SARS cases and a fear that the disease could reemerge and spread have put public health officials on high alert for any indications of possible new outbreaks. This report examines the response to SARS by public health systems in individual countries, the biology of the SARS coronavirus and related coronaviruses in animals, the economic and political fallout of the SARS epidemic, quarantine law and other public health measures that apply to combating infectious diseases, and the role of international organizations and scientific cooperation in halting the spread of SARS. The report provides an illuminating survey of findings from the epidemic, along with an assessment of what might be needed in order to contain any future outbreaks of SARS or other emerging infections.

COVID-19 pandemic—all his plans, goals, and executive orders in response to the coronavirus crisis. Shortly after being inaugurated as the 46th President of the United States, Joe Biden and his administration released this 200 page guide detailing his plans to respond to the coronavirus pandemic. The National Strategy for the COVID-19 Response and Pandemic Preparedness breaks down seven crucial goals of President Joe Biden's administration with regards to the coronavirus pandemic: 1. Restore trust with the American people. 2. Mount a safe, effective, and comprehensive vaccination campaign. 3. Mitigate spread through expanding masking, testing, data, treatments, health care workforce, and clear public health standards. 4. Immediately expand emergency relief and exercise the Defense Production Act. 5. Safely reopen schools, businesses, and travel while protecting workers. 6. Protect those most at risk and advance equity, including across racial, ethnic and rural/urban lines. 7. Restore U.S. leadership globally and build better preparedness for future threats. Each of these goals are explained and detailed in the book, with evidence about the current circumstances and how we got here, as well as plans and concrete steps to achieve each goal. Laboratory Diagnosis of Infectious Diseases Elsevier Health Sciences

The contents of this volume are based upon the proceedings of a Symposium entitled "Infectious Diseases of the Central Nervous System" held in Phoenix, Arizona, and sponsored by the Barrow Neurological Institute and Foundation during its Ninth Annual Symposium. The purpose of the Symposium was to bring together knowledgeable experts in this field to review information that is available and to enhance our knowledge of new developments in the field of infectious diseases in the central nervous system. Because the subject could not be covered in its entirety by this volume, we have placed particular emphasis on recent developments and new information. The volume includes a remarkably fresh and interesting discussion of viral diseases as they affect the nervous system, including conventional and unconventional virus agents, and in addition, discussions of pathophysiology and epidemiology and postinfectious diseases of the nervous system. A similar approach is taken to the treatment of bacterial infection. Discussions of pathophysiology are intertwined with discussions of diagnostic techniques, prevention techniques and treatment of bacterial infections. Additional surgical problems are discussed regarding prevention and management of perioperative infection and brain abscess. Special consideration was given to coccidioidomycosis which is prevalent in the western states; also, there is a discussion of parasitic infections. This volume will be of interest to neurologists and neurosurgeons and any physician dealing with infectious disease. RICHARD A. THOMPSON, M.D. JOHN R. GREEN, M.D.

The Infectious Etiology of Chronic Diseases Garland Science

The Forum on Emerging Infections was created in 1996 in response to a request from the Centers for Disease Control and Prevention and the National Institutes of Health. The goal of the forum is to provide structured opportunities for representatives from academia, industry, professional and interest groups, and government to examine and discuss scientific and policy issues that relate to research, prevention, detection, and management of emerging infectious diseases. A critical part of this mission

has been the convening of a series of workshops. Public Health Systems and Emerging Infections summarizes the fourth in a series of five workshops. With a focus on our knowledge and understanding of the role of private and public health sectors in emerging infectious disease surveillance and response, the participants explored the effects of privatization of public health laboratories and the modernization of public health care. The issues discussed included epidemiological investigation, surveillance, communication, coordination, resource allocations, and economic support.

In recent public workshops and working group meetings, the Forum on Microbial Threats of the Institute of Medicine (IOM) has examined a variety of infectious disease outbreaks with pandemic potential, including those caused by influenza (IOM, 2005) and severe acute respiratory syndrome (SARS) (IOM, 2004). Particular attention has been paid to the potential pandemic threat posed by the H5N1 strain of avian influenza, which is now endemic in many Southeast Asian bird populations. Since 2003, the H5N1 subtype of avian influenza has caused 185 confirmed human deaths in 11 countries, including some cases of viral transmission from human to human (WHO, 2007). But as worrisome as these developments are, at least they are caused by known pathogens. The next pandemic could well be caused by the emergence of a microbe that is still unknown, much as happened in the 1980s with the emergence of the human immunodeficiency virus (HIV) and in 2003 with the appearance of the SARS coronavirus. Previous Forum meetings on pandemic disease have discussed the scientific and logistical challenges associated with pandemic disease recognition, identification, and response. Participants in these earlier meetings also recognized the difficulty of implementing disease control strategies effectively.
