In recent years, a number of chronic diseases have been linked, in some cases definitively, to an infectious etiology: peptic ulcer disease with *Helicobacter pylori*, cervical cancer with several human papillomaviruses, Lyme arthritis and neuroborreliosis with *Borrelia burgdorferi*, AIDS with the human immunodeficiency virus, liver cancer and cirrhosis with hepatitis B and C viruses, to name a few. The proven and suspected roles of microbes does not stop with physical ailments; infections are increasingly being examined as associated causes of or possible contributors to a variety of serious, chronic neuropsychiatric disorders and to developmental problems, especially in children. The Infectious Etiology of Chronic Diseases: Defining the Relationship, Enhancing the Research, and Mitigating the Effects, summarizes a two-day workshop held by the Institute of Medicine's Forum on Microbial Threats to address this rapidly evolving field. Participants explored factors driving infectious etiologies of chronic diseases of prominence, identified difficulties in linking infectious agents with chronic outcomes, and discussed broad-based strategies and research programs to advance the field.

The contents of this volume are based upon the proceedings of a Symposium entitled "Infectious Diseases of the Central Nervous System" held in Phoenix, Arizona, and sponsored by the Barrow Neurological Institute and Foundation during its Ninth Annual Symposium. The purpose of the Symposium was to bring together knowledgeable experts in this field to review information that is available and to enhance our knowledge of new developments in the field of infectious diseases in the central nervous system. Because the subject could not be covered in its entirety by this volume, we have placed particular emphasis on recent developments and new information. The volume includes a remarkably fresh and interesting discussion of viral diseases as they affect the nervous system, including conventional and unconventional virus agents, and in addition, discussions of pathophysiology and epidemiology and postinfectious diseases of the nervous system. A similar approach is taken to the treatment of bacterial infection. Discussions of pathophysiology are intertwined with discussions of diagnostic techniques, prevention techniques and treatment of bacterial infections. Additional surgical problems are discussed regarding prevention and management of perioperative infection and brain abscess. Special consideration was given to coccidioidomycosis which is prevalent in the western states; also, there is a discussion of parasitic infections. This volume will be of interest to neurologists and neurosurgeons and any physician dealing with infectious disease. RICHARD A. THOMPSON, M.D. JOHN R. GREEN, M.D.

In the era of cost cutting and lack of adequate health insurance for many patients, clinical skills and time spent with patients are not adequately compensated. Yet, these dwindling and underpaid skills – good history taking, observation of and listening to patients, and physical examination of patients – remain very essential to making and reaching a complete and accurate diagnosis. Expensive laboratory and imaging diagnostics while very relevant, should not replace these age-old skills that have served to enhance and maintain the doctor-patient relationship and human connection, a connection that is often necessary for healing. *Cases in Clinical Infectious Disease Practice* uses case studies to illustrate how the infectious disease clinician processes and integrates data to arrive at a diagnosis. This type of hands-on approach, invaluable in training programs, is utilized to take the reader through initial patient encounter, through the history and physical examination, to simple laboratory findings and stains, to a final diagnosis, in a way that is easily accessible to clinicians, students, and laboratory personnel working with clinical specimens. Appeals to practitioners of all levels, with focus on patients with common problems or complications of common infections without heavy technical language Emphasizes basic clinical skills including history taking, observation, epidemiology, and physical exam, as well as simple laboratory tests, explaining how they lead to a reasonable diagnosis Presents cases seen first-hand within the community setting, reflective of cases or situations a resident or student is likely to encounter in the

real world after training *Cases in Clinical Infectious Disease Practice* is an essential resource for clinicians, graduate and medical school students, and others conducting medical and clinical microbiology or infectious disease research on real patients.

Building communication capacity is a critical piece of preparing for, detecting, and responding to infectious disease threats. The International Health Regulations (IHR) establish risk communication – "the real-time exchange of information, advice, and opinions between experts or officials and people who face a threat to their survival, health, and economic or social well-being" – as a core capacity that World Health Organization member states must fulfill to strengthen the fight against these threats. Despite global recognition of the importance of complying with IHR, 67 percent of signatory countries report themselves as not compliant. By investing in communication capacity, public health and government officials and civil society organizations facing health crises would be prepared to provide advice, information, and reassurance to the public as well as to rapidly develop messages and community engagement activities that are coordinated and take into account social and behavioral dynamics among all sectors. To learn about current national and international efforts to develop the capacity to communicate effectively during times of infectious disease outbreaks, and to explore gaps in the research agenda that may help address communication needs to advance the field, the Forum on Microbial Threats of the National Academies of Sciences, Engineering, and Medicine convened a 1.5 day workshop on December 13 and 14, 2016, in Washington, DC. Participants reviewed progress and needs in strengthening communication capacity for dealing with infectious disease threats for both outbreaks and routine challenges in the United States and abroad. This publication summarizes the presentations and discussions from the workshop.
