This book meticulously focuses on seeing technological solutions of overtourism on decimated destinations from a comprehensive viewpoint. Considering the present crisis situation, the global tourism industry is in need to formulate revised strategies to recover and to be more resilient. The book creates a platform to deliberate the measures needed to be taken to tackle the issue of this most recent crisis of COVID-19 on the lens of overtourism and technology application. The book adds some unique suggestions to direct a new outlook towards overtourism, technology solutions and decimated destinations. This book discusses the responsibilities of tourists towards decimated destinations as well as provides in-deep knowledge and debates about technological solutions to overtourism in decimated destinations.

Managing the Human Side of Information Technology IGI Global Questions on the business value of information technology (IT), which have been raised by managers and researchers for the last decade, are not settled yet. Firms invest in IT to improve their business performance. However, some firms fail to improve their business performance while others succeed. The overall value of IT varies enormously from firm to firm. Computerization does not automatically create business value, but it is one essential component that should be coupled with organizational changes such as new strategies, new business processes, and new organizational structure. Creating Business Value with Information Technology: Challenges and Solutions aims to solicit the studies that yield significant new insights into the business value of IT.

In many countries, small businesses comprise over 95% of the proportion of private businesses and approximately half of the private workforce, with information technology being used in over 90% of these businesses. As a result, governments worldwide are placing increasing importance upon the success of small business enterpreneurs and are providing increased resources to support this emphasis. Managing Information Technology in Small Business: Challanges and Solutions presents research in areas such as IT performance, electronic commerce, Internet adoption, and IT planning methodologies and focuses on how these areas impact small businesses.

Militaries with state-of-the-art information technology sometimes bog down in confusing conflicts. To understand why, it is important to understand the micro-foundations of military power in the information age, and this is exactly what Jon R. Lindsay's Information Technology and Military Power gives us. As Lindsay shows, digital systems now mediate almost every effort to gather, store, display, analyze, and communicate information in military organizations. He highlights how personnel now struggle with their own information systems as much as with the enemy. Throughout this foray into networked technology in military operations, we see how information practice—the ways in which practitioners use technology in actual operations—shapes the effectiveness of military performance. The quality of information practice depends on the interaction between strategic problems and organizational solutions. Information Technology and Military Power explores information practice through a series of detailed historical cases and ethnographic studies of military organizations at war. Lindsay explains why the US military, despite all its technological advantages, has struggled for so long in unconventional conflicts against weaker adversaries. This same perspective suggests that the US retains important advantages against advanced competitors like China that are less prepared to cope with the complexity of

information systems in wartime. Lindsay argues convincingly that a better understanding of how personnel actually use technology can inform the design of command and control, improve the net assessment of military power, and promote reforms to improve military performance. Warfighting problems and technical solutions keep on changing, but information practice is always stuck in between.

The role of information technology (IT) has becoming increasingly important in both private and public sectors over recent years. The advent of personal computers, information networks, and the Internet has engendered an information revolution, which has created new means of production, new communication patterns, and new work processes. The ability to buy and sell goods and services via the Internet has led to new private sector industries and new business and government models. Furthermore, there is an emerging realization that implementation of IT is more than just a shift in communication patterns or mediums. At least potentially, it involves a transformation of an organization's culture.

This book attempts the challenging task of unravelling the complexities of today's web-based information technology solutions. To achieve this goal, the book provides a guided tour of one specific system, the Moodle learning management system. Using Moodle as the case study, key concepts of computer programming, data storage and databases, web technologies and networking are introduced, emphasising how these technologies work together to achieve the overall solution. The book also introduces the people and organisational contexts around a system like Moodle. It showcases the interrelationships between technologies and people in their varied roles as users, decision makers, developers or system maintainers.The book is directed at readers who are confident in using information technologies (such as browsing the Web) yet have limited understanding of how computers and information technology systems work. It uses informal language to explain complex contexts, supported by sketches and analogies. The book is not a Moodle book in the typical sense. It does not provide a user guide to Moodle, nor does it explain how to teach using Moodle. The book is aimed at readers with interest in understanding information technology solutions. Those readers will gain understanding of key technologies and concepts, transferable to many other systems. Readers with a strong interest in Moodle will gain a solid understanding of how Moodle works, preparing them for tasks that bridge the interface between users, organisations and developers. The author, Eva Heinrich, holds a masters degree in computer science, a PhD in information systems and a doctorate in education. She teaches computer science and information technology at Massey University, New Zealand, and conducts research into learning technologies and higher education.
