This edited volume provides both conceptual and practical information for conducting and evaluating evidence-based outcome studies. It encompasses psychotherapy research for traditional mental health disorders (eg. depression, anxiety), as well as psychosocial-based treatments provided to medical patient populations to have impact either on the disease process itself (pain, cardiovascular risk) or to improve the quality of life of such individuals. This is a hands-on book, whose major emphasis is on the practical nuts-and-bolts implementation of psychosocial-based RCTs from conception to completion.

As software R&D investment increases, the benefits from short feedback cycles using technologies such as continuous deployment, experimentation-based development, and multidisciplinary teams require a fundamentally different strategy and process. This book will cover the three overall challenges that companies are grappling with: speed, data and ecosystems. Speed deals with shortening the cycle time in R&D. Data deals with increasing the use of and benefit from the massive amounts of data that companies collect. Ecosystems address the transition of companies from being internally focused to being ecosystem oriented by analyzing what the company is uniquely good at and where it adds value.

You have a great idea, now what? That first mile—where an innovation moves from an idea on paper to the market—is often plagued by

failure. In fact, less than one percent of ideas launched by big companies end up having real impact. The ideas aren't the problem. It's the process. The First Mile focuses on the critical moment when an innovator moves from planning to reality. It is a perilous place where hidden traps snare entrepreneurs and roadblocks slow innovators inside large companies. In this practical and enlightening manual, strategic adviser Scott Anthony equips innovators with new tools, questions, and examples to speed through this crucial early stage of innovation. You'll learn:

- How to evaluate your idea's strengths and weaknesses using the "DEFT" process—Document, Evaluate, Focus, and Test
- Fourteen recipes from an "experiment cookbook" to gain confidence in your idea or business
- Why "spinouts," "wrong turns," and other challenges commonly trip up innovation—and the practical strategies you can use to avoid them
- Why innovators need to seek chaos in an age of constant change—and other essential leadership skills

Drawing on his decade of experience as an innovation adviser and investor, Anthony describes hard-won lessons from disruptive start-ups and global giants alike. The First Mile will give you the knowledge and confidence to travel this perilous—but ultimately promising—terrain. The first mile can be a scary place, but you don't have to traverse it alone. This book can help.

Charles Curran in his newest book *The Development of Moral Theology: Five Strands*, brings a unique historical and critical analysis to the five strands that differentiate Catholic moral theology from other approaches to Christian ethics—sin and the manuals of moral theology, the teaching of Thomas Aquinas and later Thomists, natural law, the role of authoritative church teaching in moral areas, and Vatican II. Significant changes have occurred over the course of these historical developments. In addition, pluralism and diversity exist even today, as illustrated, for example, in the theory of natural law proposed by Cardinal Ratzinger. In light of these realities, Curran proposes his understanding of how the strands should influence moral theology today. A concluding chapter highlights the need for a truly theological approach and calls for a significant change in the way that the papal teaching office functions today and its understanding of natural law. In a work useful to anyone who studies Catholic moral theology, *The Development of Moral*

Theology underscores, in the light of the historical development of these strands, the importance of a truly theological and critical approach to moral theology that has significant ramifications for the life of the Catholic church.

Many countries have implemented policies to increase the number and quality of scientific researchers as a means to foster innovation and spur economic development and progress. To that end, grounded in a view of women as a rich, yet underutilized knowledge and labor resource, a great deal of recent attention has focused on encouraging women to pursue education and careers in science—even in countries with longstanding dominant patriarchal regimes. Yet, overall, science remains an area in which girls and women are persistently disadvantaged. This book addresses that situation. It bridges the gap between individual- and societal-level perspectives on women in science in a search for systematic solutions to the challenge of building an inclusive and productive scientific workforce capable of creating the innovation needed for economic growth and societal wellbeing. This book examines both the role of gender as an organizing principle of social life and the relative position of women scientists within national and international labor markets. Weaving together and engaging research on globalization, the social organization of science, and gendered societal relations as key social forces, this book addresses critical issues affecting women's contributions and participation in science. Also, while considering women's representation in science as a whole, examinations of women in the chemical sciences, computing, mathematics and statistics are offered as examples to provide insights into how differing disciplinary cultures, functional tasks and socio-historical conditions can affect the advancement of women in science relative to important variations in educational and

occupational realities. Edited by three social scientists recognized for their expertise in science and technology policy, education, workforce participation, and stratification, this book includes contributions from an intellectually diverse group of international scholars and analysts and features compelling cases and initiatives from around the world, with implications for research, industry practice, education and policy development.

Art, Research, Philosophy explores the emergent field of artistic research: art produced as a contribution to knowledge. As a new subject, it raises several questions: What is art-as-research? Don't the requirements of research amount to an imposition on the artistic process that dilutes the power of art? How can something subjective become objective? What is the relationship between art and writing? Doesn't description always miss the particularity of the artwork? This is the first book-length study to show how ideas in philosophy can be applied to artistic research to answer its questions and to make proposals for its future. Clive Cazeaux argues that artistic research is an exciting development in the historical

debate between aesthetics and the theory of knowledge. The book draws upon Kant, phenomenology and critical theory to show how the immediacies of art and experience are enmeshed in the structures that create knowledge. The power of art to act on these structures is illustrated through a series of studies that look closely at a number of contemporary artworks. This book will be ideal for postgraduate students and scholars of the visual and creative arts, aesthetics and art theory.

Since its emergence in the 1980s the national innovation system (NIS) concept has become widely used by scholars and policymakers alike. In the course of its rapid diffusion it has provoked controversy on fundamental issues. Where did NIS emerge? What is the theoretical core of the concept? Is it actually a scientific concept or simply a buzz-word? How useful is it in terms of low income countries? How does the national innovation system relate to economic, social and environmental sustainable development? Is it meaningful to study national systems in a globalizing economy? What are the legitimate policy implications? This book provides an in depth analysis of all these questions as well as recommending future avenues of research.

This book presents new evidence concerning the influential role of context and institutions on the relations between knowledge, innovation, clusters and learning. From a truly international perspective, the expert contributors capture the most interesting and relevant aspects of knowledge economy. They explore an evolutionary explanation of how culture can play a significant role in learning and the development of skills. Presenting new data and theory developments, this insightful book reveals

how changes in the dynamics of knowledge influence the circumstances under which innovation occurs. It also examines cluster development in the knowledge economy, from regional to virtual space. This volume will prove invaluable to academics and researchers who are interested in exploring new ideas surrounding the knowledge economy. Those employed in consultant firms and the public sector, where an understanding of the knowledge economy is important, will also find plenty of relevant information in this enriching compendium.

The "Pacific War" narrative of Japan's defeat that was established after 1945 started with the attack on Pearl Harbor, detailed the U.S. island-hopping campaigns across the Western Pacific, and culminated in the atomic bombings of Hiroshima and Nagasaki, Japan's capitulation, and its recasting as the western shore of an American ocean. But in the decades leading up to World War II and over the course of the conflict, Japan's leaders and citizens were as deeply concerned about continental Asia—and the Soviet Union, in particular—as they were about the Pacific theater and the United States. In *Imperial Eclipse*, Yukiko Koshiro reassesses the role that Eurasia played in Japan's diplomatic and military thinking from the turn of the twentieth century to the end of the war. Through unprecedented archival research, Koshiro has located documents and reports expunged from the files of the Japanese Cabinet, ministries of Foreign Affairs and War, and Imperial Headquarters, allowing her to reconstruct Japan's official thinking about its plans for continental Asia. She brings to light new information on the assumptions and resulting plans that Japan's leaders made as military defeat became increasingly certain and the Soviet Union slowly moved to declare war on Japan (which it finally did on August 8, two days after Hiroshima). She also describes Japanese attitudes toward Russia in the prewar years, highlighting the attractions of communism and the treatment of Russians in the Japanese empire; and she traces imperial attitudes toward Korea and China throughout this period. Koshiro's book offers a balanced and comprehensive account of imperial Japan's global ambitions.

Under a framework in which technology and organizational innovation are markedly separated, this book advances knowledge on the topic by exploring the antecedents of a firm's adoption of organizational innovation and its performance consequences. The concept of organizational innovation encompasses the introduction of new administrative organizational and managerial activities, although currently it is accepted that these terms overlap. There are two different kinds of organizational innovation, usually inter-related: structural innovations(organizational arrangement

and the division of labour within it) and managerial innovations (the way a firm organizes its activities or its personnel). Based on papers from the Organizational Innovation and its Background, Consequences and Technological Complementarities Performance Conference, this volume contributes to the organizational and innovation literature by providing insights on the antecedents of the adoption of management innovation; exploring the complementary roles of management and technological innovation; addressing the performance consequences of management innovation adoption with and without technological innovation; and discusses management innovation using the resource-based view, thus enriching that theoretical approach.

The Accelerating Transport Innovation Revolution: A Global, Case Study-based Assessment of Current Experience, Cross-sectorial Effects and Socioeconomic Transformations, offers a comprehensive view of current state-of-the-art and practices around the world to create innovation on a revolutionary scale and connect research to commercial exploitation of its results. It offers a fascinating new model of the innovation process based on theories of biological ecosystems, general systems theory and basins of attraction (represented through space-time graphs well known in mathematics). Furthermore, it considers - through a number of dedicated chapters - key issues and elements of innovation ecosystems, such as: Causal Factors and system constraints affecting the development and sustainability of innovation ecosystems (Chapter 4); Review of innovation organization and governance in key countries and regions (Chapter 5); the role of technological "Spillovers" (Chapter 6); Collection and use of data for innovation monitoring and benchmarking (Chapter 7); Intellectual Property protection between competing ecosystems (Chapter 8); Economics of innovation (Chapter 9); Public and private sector involvement in Transport innovation creation (Chapter 10); the role of the individual entrepreneur - innovator in energizing change (Chapter 11). Finally, in Chapter 12, there is a thorough summary of key findings. This book uses a paradigmatic approach to augment the innovation ecosystem model of innovation that integrates beliefs and learning into the innovation ecosystems model. It therefore includes ten case studies from the U.S., Europe and Asia, detailing how innovation is created across continents and different ecosystems and what are the critical lessons to be learned. It does this, effectively, at five different levels of

analysis i.e. the individual innovator / entrepreneur level, the organization level (government agency or company), the regional ecosystem level, the nation-state level and the global - systemic or international level. Each level of analysis, reveals unique features of the innovation landscape and the ten case studies allow the reader to assess when and where specific "enablers" are facilitating innovation especially on a revolutionary scale. The need for the book came from the realization that despite the billions of dollars spent on various research programs over the past 20 years (especially in the public sector), there have been few clear and tangible efforts directed at exploring how innovation production increasingly occurs and the critical factors necessary to sustain large-scale, revolutionary change as the future unfolds. Thus, a primary theme of the book is that understanding how research results translate into market innovation and implementation, especially understanding the nature of revolutionary innovation, is as important as the creation of innovations themselves. While the focus of the book is on Transportation, the concepts and recommendations presented apply to other fields too. Formulates and presents a workable and comprehensive new model of innovation Defines and analyzes many concepts and notions related to innovation, research and market implementation Examines the critical factors affecting innovation production and successful commercial implementation of research results Examines organizational models of coordination, governance, data collection, process analysis and use of intellectual property tools Includes recent, well-researched and documented case studies of successful innovation ecosystems across the world mainly - but not only - in the Transport field

Higher education policy has increasingly gained a European dimension, with its own distinct influence over national education policies. Against this background, a major project was launched, the REFLEX project, which aims to make a contribution to assessing the demands that the modern knowledge society places on higher education graduates, and the degree to which higher education institutions in Europe are up to the task of equipping graduates with the competencies needed to meet these demands. The project also looks at how the demands, and graduates' ability to realise them, is influenced by the way in which work is organised in firms and organisations. The REFLEX project has been carried out in sixteen different

countries and consisted of a large scale survey among some 70.000 graduates. This report presents the major findings and draws important policy implications.

Zen Buddhism is perhaps best known for its emphasis on meditation, and probably no figure in the history of Zen is more closely associated with meditation practice than the thirteenth-century Japanese master Dogen, founder of the Soto school. This study examines the historical and religious character of the practice as it is described in Dogen's own meditation texts, introducing new materials and original perspectives on one of the most influential spiritual traditions of East Asian civilization. The Soto version of Zen meditation is known as "just sitting," a practice in which, through the cultivation of the subtle state of "nonthinking," the meditator is said to be brought into perfect accord with the higher consciousness of the "Buddha mind" inherent in all beings. This study examines the historical and religious character of the practice as it is described in Dogen's own meditation texts, introducing new materials and original perspectives on one of the most influential spiritual traditions of East Asian civilization.

Innovation is increasingly recognized as a vitally important social and economic phenomenon worthy of serious research study. Firms are concerned about their innovation ability, particularly relative to their competitors. Politicians care about innovation, too, because of its presumed social and economic impact. However, to recognize that innovation is desirable is not sufficient. What is required is systematic and reliable knowledge about how best to influence innovation and to exploit its effects to the full. Gaining such knowledge is the aim of the field of innovation studies, which is now at least half a century old. Hence, it is an opportune time to ask what has been

achieved and what we still need to know more about. This is what this book sets out to explore. Written by a number of central contributors to the field, it critically examines the current state of the art and identifies issues that merit greater attention. The focus is mainly on how society can derive the greatest benefit from innovation and what needs to be done to achieve this. However, to learn more about how society can benefit more from innovation, one also needs to understand innovation processes in firms and how these interact with broader social, institutional and political factors. Such issues are therefore also central to the discussion here.
