Science in Medicine: The JCI
Textbook of Molecular Medicine is a collection of acclaimed articles published in the Journal of Clinical Investigation during the Journal's tenure at Columbia University. The

society that publishes the JCI, the American Society for Clinical Investigation (ASCI), is an honor society of physician scientists, representing those who are at the forefront of translating findings in the laboratory to the advancement of clinical practice. This textbook brings together state-of-the-art reviews written by the world's leading authorities, including many ASCI members. The reviews examine the molecular mechanisms underlying a wide array of diseases and disorders affecting all major organ systems. The fundamentals of the organ or physiological systems in question are present alongside

the underlying genetic or physiological abnormalities that result in disease. This text illustrates the translation of basic scientific knowledge into the current practice of clinical medicine. The reviews provide an authoritative and comprehensive overview by building on known scientific concepts and treatment of human disease while exploring where these advances might take medicine over the next decade. The book is a valuable resource for medical students, graduate students, house staff, attending and practicing physicians, and biomedical researchers.

In 1986 the first edition of Continuous Ambulatory Peritoneal Dialysis, edited by R. Gokal, was published. In 1989 the third edition of Peritoneal Dialysis, edited by K.D. Nolph, was published. Both books were widely recognized for their comprehensive discussion of this particular field. Rather than edit new editions of each of these books separately, two of the most prominent figures in this field have decided to combine their knowledge and enthusiasm in this single book: The Textbook of Peritoneal Dialysis. The book is unique in its detailed discussion of a complete range of topics, including new advances in our understanding of the physiology of peritoneal dialysis, peritoneal dialysis kinetics, clinical results and a chapter dealing with the concepts of intraperitoneal chemotherapy. These examples of

the dynamic nature of the field further illustrate the importance of this textbook, and make it required reading for everybody working within the field of peritoneal dialysis.

Workbook to Accompany: Physics for Students of Science and Engineering is 25-chapter workbook designed to accompany the Physics for Students of Science and Engineering textbook. This workbook is a collection of question and problems that are representative of the topics covered in the textbook. The format of this workbook is based on individual

chapters of the textbook. The questions and problems associated with each chapter begin with a one-page review of the definitions, units, and simple relationships appropriate to that chapter. Each review, in the form of questions and one-step problems, is followed by more comprehensive problems, formatted one to a page. Each problem is stated at the top of a page, and the student is provided space to execute each element of the problem-solving procedure. A detailed solution to each problem is presented in the same form, such as in the format of the problem solving procedure, on the reverse side of the page. The solution page often includes comments and suggestions appropriate to the specific type of problem being considered. The opening chapters include discussions on particle kinematics and dynamics; applications of Newton's laws; and work, power, and energy. The subsequent chapters explore the concepts of momentum, collisions, rotational motion, oscillations, mechanics of fluids, heat, and thermodynamics.

Other chapters examine the principles of electric charge, electric fields, electric potential, capacitance, current, resistance, direct-current circuits, magnetic fields, and electromagnetic oscillations. The remaining chapters deal with wave motion, sound, geometric and physical optics, special relativity, early quantum physics, and wave mechanics. This workbook will be of great benefit to physics teachers and students.

Oxford University Press, USA

The three-volume work *Perceiving in Depth* is a sequel to *Binocular Vision and Stereopsis* and to *Seeing in Depth*, both by Ian P. Howard and Brian J. Rogers. This work is much broader in scope than the previous books and includes mechanisms of depth perception by all senses,

including aural, electrosensory organs, and the somatosensory system. Volume 1 reviews sensory coding, psychophysical and analytic procedures, and basic visual mechanisms. Volume 2 reviews stereoscopic vision. Volume 3 reviews all mechanisms of depth perception other than stereoscopic vision. The three volumes are extensively illustrated and referenced and provide the most detailed review of all aspects of perceiving the three-dimensional world. Volume 1 starts with a review of the history of visual science from the ancient Greeks to the early 20th century with special attention devoted to the discovery of the principles of perspective and stereoscopic vision. The first chapter also contains an account of early visual display systems, such as panoramas and peepshows, and the development of stereoscopes and

stereophotography. A chapter on the psychophysical and analytic procedures used in investigations of depth perception is followed by a chapter on sensory coding and the geometry of visual space. An account of the structure and physiology of the primate visual system proceeds from the eye through the LGN to the visual cortex and higher visual centers. This is followed by a review of the evolution of visual systems and of the development of the mammalian visual system in the embryonic and post-natal periods, with an emphasis on experience-dependent neural plasticity. An account of the development of perceptual functions, especially depth perception, is followed by a review of the effects of early visual deprivation during the critical period of neural plasticity on amblyopia and other defects in depth perception. Volume 1 ends with

accounts of the accommodation mechanism of the human eye and vergence eye movements.
