Abstract: Artificial intelligence has already been applied to many areas since its official birth in 1956, but most of the applications ended up in great disappointments as the benefits they reaped were very low. Due to this reason the vast interest in applying this relatively young technology to business calmed down in the late seventies when scientists recognized that the current intelligent systems were not yet plug-and-play solutions, hence mature enough to fully

meet the business needs and today and especially in the requirements at that time. However, the limited commercial applicability of artificial intelligence in the past has to be rethought today as with the significant progress in artificial intelligence research and the growth of electronic commerce conducted over the World Wide Web new opportunities for business applications of artificial intelligence have emerged consequently. Nowadays horizontal and vertical electronic commerce is significantly driven by intelligent applications. Their employment in electronic businesses may well generate huge returns on investments, providing a technology-based response to increasing competition, the volatility of business models, and the pace of technology change. Despite the wide assumption that artificial intelligence will have a major impact on Internet-related businesses next years to come, it is uncertain to what extent it performs and will perform that way. The purpose of this thesis is to analyse, assess and evaluate the potential of commercial applications of artificial intelligence in electronic businesses. Therefore the main research question of this paper is whether artificial intelligence is reasonably applicable in Internet-related businesses, first in terms of effectiveness and second in terms of efficiency. In the assessment the application of artificial intelligence in electronic businesses is represented by the employment of intelligent agents. In harmony with the major research question emphasized above, the paper provides a thorough discussion about the economic impact of the most common and relevant application types of intelligent agents on

electronic commerce environments. In addition the driving underlying technologies of intelligent agents are analysed with respect to artificial intelligence techniques and methods, and current standardisation efforts. [...] [Intelligent Enterprise](#) Springer Nature

In an election year in which everyone seems to be looking for change, Tom Cronin reminds us that it is important to look back at presidential precedents and pitfalls, carrying forward these lessons as we look ahead in the "search for the perfect president." America has never had a perfect president, nor are we likely to. We yearn for qualities of mind, character, and experience that are rarely found in one person.

Candidates always have the flaws associated with being human. Noted presidential scholar Thomas E. Cronin helps us consider these realities with clarity and empathy, as one who has both written about presidents and run for office himself. Cronin unabashedly issues three cheers for those who run, and for all their helpers and advisers who provide us choices. In this election year, incredible diversity and therefore sharp disagreements of ideology and values prevail. Cronin puts all this in context with the history of the American presidency from George Washington to George W. Bush with a special focus on what he calls the "Act

III" presidency of JFK. He takes us from the fiction of "searching for the perfect president" to the facts of the presidency in the post-9/11 world. Whether the next president is soldier, shaman, or somewhere in-between, Cronin gives us a glimpse of presidents future through the lens of presidents past.

In this penetrating study of how knowledge-based services and technology are revolutionizing the economy and every corporate strategy, James Brian Quinn argues that the successful companies of the 90's -- whether in manufacturing or services -- will derive their competitive edge not from ephemerally superior products but from a deep understanding of a few highly developed knowledge and service based "core competencies." Rarely will owning the largest raw materials resource, manufacturing plants, equipment bases, or integrated facilities provide a maintainable competitive edge for major companies. Such physical properties are too easily cloned or bypassed. From now on, Quinn documents, intelligent enterprises will derive sustainable advantage from knowledge and service based

activities that leverage intellectual assets. They will increase value through technological sophistication, better knowledge bases, more creative customer responsiveness, and the unsurpassed management of human and intellectual capital that competitors cannot reproduce. Quinn analyzes the technological and economic forces that make such strategies essential. He shows in detail how to create and leverage knowledge and service based core competencies for maximum focus and effectiveness. Managers, Quinn asserts, must define each value-creating activity as a knowledge based service and determine whether or not they can perform that service -- be it research, design, inventory control, accounting, distribution, or advertising -- better than anyone else in the world. Using examples from companies such as Merck, Honda, Apple, Boeing, and Wal-Mart, Quinn describes how forward-looking companies can best perform needed analyses and implement strategies around selected core competencies. By eliminating or "outsourcing" less important functions to superior outside

vendors, firms become more responsive, decentralized, and lean. They become the "intelligent enterprises" of the 1990s, leveraging human and capital resources much more than other firms. They may also take on radically new organizational forms, become "starburst," "inverted," "infinitely flat," or "spiders' web" configurations. By designing and benchmarking their knowledge and service based activities to be "best in world," managers can obliterate overhead costs, smash bureaucracies, motivate personnel, and create greater value for customers and shareholders alike.

Innovation Strategy for the Knowledge Economy Simon and Schuster

This book reports on research and developments in human-technology interaction. A special emphasis is given to human-computer interaction, and its implementation for a wide range of purposes such as healthcare, aerospace, telecommunication, and education, among others. The human aspects are analyzed in detail. Timely studies on human-centered design, wearable technologies, social and affective computing, augmented, virtual and mixed reality simulation, human

rehabilitation and biomechanics represent the core of the book. Emerging technology applications in business, security, and infrastructure are also critically examined, thus offering a timely, scientifically-grounded, but also professionally-oriented snapshot of the current state of the field.

The book is based on contributions presented at the 3rd International Conference on Human Interaction and Emerging Technologies: Future Applications, IHJET 2020, held on August 27-29, 2020. It offers a timely survey and a practice-oriented reference guide to researchers and professionals dealing with design and/or management of the new generation of service systems.

This book is open access. Focusing on education and information management with modernization, ICMEIM 2024 provides a platform for scholars in related fields to exchange and share information, discuss how the two affect each other, and:

- Promote the modernization of education by studying certain educational issues that exist.
- Open up new perspectives, broaden horizons, and examine the issues under discussion by participants.
- Create a forum for sharing, research and exchange at an international level, where participants will be informed of the latest research directions, results and content in different fields, thus inspiring them to come up

with new research ideas. The organizing committee of conference is delighted to invite you to participate in this exciting event, which also paves way for young researchers in acquiring knowledge and information by meeting the experts.

Innovation Strategy for the Knowledge Economy is intended for managers who have practiced the best of quality and re-engineering management techniques and are ready to transform their organizations with the systematic notions of knowledge creation and application. It is for organization leaders who prefer to be inspired with innovation strategy than hit over the head with change management techniques. It does not deal with barriers, hurdles, or conflicts to be resolved; rather, it paints a possible vision of how we can take advantage of our collective learning to move an enterprise forward. This book provides the reader with a sound, practical framework for instituting innovation strategy beyond the traditional definition of flow of parts or finances. At the core is an understanding of the dual value of knowledge (content) and

innovation (process) using 'real-time' learning as the methodology. Innovation Strategy for the Knowledge Economy introduces new managerial concepts such as: Value-System versus Value-Chain Strategic Business Network (SBN) versus Strategic Business Unit (SBU) Customer Success versus Customer Satisfaction It is an invaluable resource for both managers and organization leaders. Debra Mae Amidon is Founder and Chief Strategist of Entovation International, a global innovation research and consulting network with outposts throughout the world. Her specialties include: knowledge management, learning networks, customer innovation, and enterprise transformation. Ms. Amidon holds degrees from Boston University, Columbia and MIT, where she was an Alfred P. Sloan Fellow.

Smart city development has emerged a major issue over the past 5 years. Since the launch of IBM's Smart Planet and CISCO's Smart Cities and Communities programmes, their potential to deliver on global sustainable development targets have captured the public's attention. However, despite this growing interest in the development of smart cities, little has as yet been published that either sets out the state-of-the-art, or which offers a less than subjective, arm's length

and dispassionate account of their potential contribution. This book brings together cutting edge research and the findings from technical development projects from leading authorities within the field to capture the transition to smart cities. It explores what is understood about smart cities, playing particular attention on the governance, modelling and analysis of the transition that smart cities seek to represent. In paving the way for such a representation, the book begins to account for the social capital of smart communities and begins the task of modelling their embedded intelligence through an analysis of what the "embedded intelligence of smart cities" contributes to the sustainability of urban development. This innovative book offers an interdisciplinary perspective and shall be of interest to researchers, policy analysts and technical experts involved in and responsible for the planning, development and design of smart cities. It will also be of particular value to final year undergraduate and postgraduate students interested in Geography, Architecture and Planning. *Working Hard, Working Poor* ??????????????
