Interactive Physiology@ Quiz: Urinary System: Anatomy Review This activity contains 10 questions. After urine is produced in the kidney, it leaves the kidney via the: Human Physiology/The Urinary System

Anatomy of the Urinary System. The urinary system consists of two kidneys, two ureters, a urinary bladder, and a urethra. The kidneys alone perform the functions just described and manufacture urine in the process, while the other organs of the urinary system provide temporary storage reservoirs for urine or serve as transportation channels to carry it from one body region to another.

An example of the urinary system working with the respiratory system to regulate blood pH would be A) When you hold your breath the kidneys will remove CO<sub>2</sub> from your blood B) If you exercise a lot your urine will become more acidic

... Urinary System: Glomerular Filtration

The organ system that performs this function in humans—the urinary system—is the topic of this chapter. The organs of the urinary system are organs of excretion—they remove wastes and water from the body. Specifically, the urinary system “cleans the blood” of metabolic wastes, which are substances produced by the

body that it cannot
