This thesis provides a detailed-description of existing and projected C41 systems within a regiment as well as the Information Technology (IT) architectures necessary to inter-connect those assets. An overview of the Individual Training Standards (ITS) and their relationship to IT services and support is addressed in addition to the shortcomings of existing ITS for the 06XX and 40XX Military Occupational Specialties (MOS). The methodology used to identify task descriptions and performance steps required to support specific C41 systems is identified as well as a proposed MOS structure for the IT related fields. The results obtained from identifying tasks and competencies of the Tactical Combat Operations system, Intelligence Analysis System, Intelligence Operations Workstation, and Tactical Data Network are applied to a competency progression model. This model is used to identify the core and core plus competencies necessary to support specific C41 systems employed at the regimental level. Applying survey instrument and interview questions, a hypothesis regarding IT competencies was tested. The survey questionnaire and interview questions focus on IT related standard operating procedures, existing IT competencies, IT related functional redundancies commercial outsourcing of IT support, unit priorities, and IT skill requirements.

This project is aimed at those with no prior knowledge: None at all. Aiming for 'simple is best' and the KISS principle ('keep it simple stupid') means that everything in this book is 'simplified for clarity'. The diagrams will not be over-dense blueprints and, wherever I make a grand sweeping statement, I will completely omit to mention any exceptions to the rule. I'll do my best not to use big words, abbreviations, or use any numbers. To keep us on track, I've put 'look up watchwords' at the end of each part. These are intended to be entered into your favorite internet search engine. By providing these sign posts, those who want more information can go off and get it, whilst the rest of us carry on regardless. With my excuses made, I hope you get as much out this informal introduction to marine engineering as I got from writing it. My only real promise is any revenue made from this tome shall be used exclusively for foolish, unwise and meaningless adventures. The Condition Assessment Scheme (CAS) for oil tankers was adopted in 2001 and is applicable to all single-hull tankers of 15 years or older. Although the CAS does not specify structural standards in excess of the provisions of other IMO conventions, codes and recommendations, its requirements stipulate more stringent and transparent verification of the reported structural condition of the ship and that documentary and survey procedures have been properly carried out and completed. The Scheme requires that compliance with the CAS is assessed during the Enhanced Survey Program of Inspections concurrent with intermediate or renewal surveys currently required by resolution A.744(18), as amended.--Publisher's description.

How to collect data about cognitive processes and events, how to analyze CTA findings, and how to communicate them effectively: a handbook for managers, trainers, systems analysts, market researchers, health professionals, and others. Cognitive Task Analysis (CTA) helps researchers understand how cognitive skills and strategies make it possible for people to act effectively and get things done. CTA can yield information people need—employers faced with personnel issues, market researchers who want to understand the thought processes of consumers, trainers and others who design instructional systems, health care professionals who want to apply lessons learned from errors and accidents, systems analysts developing user specifications, and many other professionals. CTA can show what makes the workplace work—and what keeps it from working as well as it might. Working Minds is a true handbook, offering a set of tools for doing CTA: methods for collecting data about cognitive processes and events, analyzing them, and communicating them effectively. It covers both the "why" and the "how" of CTA methods, providing examples, guidance, and stories from the authors' own experiences as CTA practitioners. Because effective use of CTA depends on some conceptual grounding in cognitive theory and research—on knowing what a cognitive perspective can offer—the book also offers an overview of current research on cognition. The book provides detailed guidance for planning and carrying out CTA, with chapters on capturing knowledge and capturing the way people reason. It discusses studying cognition in real-world settings and the challenges of rapidly changing technology. And it describes key issues in applying CTA findings in a variety of fields. Working Minds makes the methodology of CTA accessible and the skills involved attainable.
