This textbook focuses on a set of skills-based learning outcomes common among undergraduate environmental

programs. It covers critical scientific skills and ways of thinking that bridge the gap between the knowledge-based content of introductory environmental textbooks and the professional skills students of the environment need to succeed in both their academic programs and professional careers. This emphasis on skills is gaining more traction among academic programs across the country as they shift focus from knowledge delivery to learning outcomes and professional competencies. The book features clear methodological frameworks, engaging practice

exercises, and a range of assessment case studies suitable for use across academic levels. For introductory levels, this text uses guided practice exercises to expose students to the skills they will need to master. At the capstone level, this text allows students to apply the knowledge they have gained to real-world issues and to evaluate their competency in key programmatic learning outcomes. A detailed answer key with rubrics customized for specific questions and sample answers at various competency levels is available to verified course instructors. Access

Entrepreneurship and

innovation are increasingly viewed as key contributors to global economic and social development.

University-based entrepreneurship ecosystems (U-BEEs) provide a supportive context in which entrepreneurship and innovation can thrive.

In that vein, this book provides critical insight based on cutting-edge analyses of how to frame, design, launch, and sustain efforts in the area of entrepreneurship.

Seven success factors were derived from an in-depth analysis of six leading, and very different, university-based entrepreneurship ecosystems in North America, Latin America, Europe, and Asia. These seven success factors are: (1) senior leadership

vision, engagement and sponsorship; (2) strong programmatic and faculty leadership; (3) sustained commitment over a long period of time; (4) commitment of substantial financial resources; (5) commitment to continuing innovation in curriculum and programs; (6) an appropriate organizational infrastructure; and (7) commitment to building the extended enterprise and achieving critical mass.

Based on these success factors, the authors provide a series of recommendations for the development of a comprehensive university-based entrepreneurship ecosystem. This major assessment of how best to drive university-based entrepreneurship

This open-access book is based on the observation that learning ecosystems are increasingly established in higher education institutions. However, an important aspect that is still missing is their interconnectedness . Consequently, the book intends to close this gap by introducing the concept of a distributed learning ecosystem (DLE). A DLE follows the idea of establishing an interlinkage between decentralised learning ecosystems (consisting of content repositories and educational resources) and thus serves as an integrated approach that enables learners to access and use learning content and share resources.

research with leading education researchers, administrators and practitioners, to show how an understanding of urban ecosystems is vital for urban dwellers to grasp the fundamentals of ecological and environmental science and to understand their own environment. Discovering Ecology Good Year Books	explains this lack of psychological motivation and change? Why is it so hard to change our lives? This book addresses this question by means of a philosophical inquiry into the conditions of possibility for environmental change. It discusses how we can become more motivated to do environmental good and what kind of knowledge we need for this, and explores the relations between motivation, knowledge, and modernity. After reviewing a broad range of possible philosophical and	psychological responses to environmental apathy and inertia, the author argues for moving away from a modern focus on either detached reason and control (Stoicism and Enlightenment reason) or the natural, the sentiments, and the authentic (Romanticism), both of which make possible disengaging and alienating modes of relating to our environment. Instead he develops the notion of environmental skill: a concept that

bridges the gap between knowledge and action, re-interprets environmental virtue, and suggests an environmental ethics centered on experience, know-how and skillful engagement with our environment. The author then explores the implications of this ethics for our lives: it changes the way we think about , and deal with, health, food, animals, energy, climate change, politics, and technology. Climate Change:	Effects: Climate and Ecosystems Gr. 5-8 WorldFish Skills and workforce development are at the heart of much research on work, employment, and management. But are they so important? To what extent can they make a difference for individuals, organizations, and nations? How are the supply and, more importantly, the utilization of skill, currently evolving? What are the key factors shaping skills trajectories of the future? This Handbook provides an authoritative consideration of issues such as these. It does so by drawing on experts in a wide range of disciplines including sociology, economics,

labour / industrial relations, human resource management, education, and geography. The Handbook is relevant for all with an interest in the changing nature - and future - of work, employment, and management. It draws on the latest scholarly insights to shed new light on all the major issues concerning skills and training today. While written primarily by leading scholars in the field, it is equally relevant to policy makers and practitioners responsible for shaping the development of human capability today and into the future.
