Tony Gaddis's accessible, step-by-step presentation helps beginning students understand the important details necessary to become skilled programmers at an introductory level. Gaddis motivates the study of both programming skills and the C++ programming language by presenting all the details needed to understand the "how" and the "why" - but never losing sight of the fact that most beginners struggle with this material. His approach is both gradual and highly accessible, ensuring that students understand the logic behind developing high-quality programs. In Starting Out with C++: From Control Structures through Objects, Gaddis covers control structures, functions, arrays, and pointers before objects and classes. As with all Gaddis texts, clear and easy-to-read code listings, concise and practical real-world examples, and an abundance of exercises appear in every chapter. This text is intended for either a

one-semester accelerated introductory course or a traditional two-semester sequence covering C++ programming. This edition is available with MyProgrammingLab, an innovative online homework and assessment tool. Through the power of practice and immediate personalized feedback, MyProgrammingLab helps students fully grasp the logic, semantics, and syntax of programming. *Note:* If you are purchasing the standalone text or electronic version, MyProgrammingLab does not come automatically packaged with the text. Authority is something we experience every day, but is it necessary? Many think that it is not, and that it exists only as a remedy for some defect in us. Victor Lee Austin sets about exploring the higher and nobler functions of authority, and in doing so reveals its human importance as more than simply a provision for human inadequacies. A significant contribution to Christian anthropology, the book illuminates an indispensable feature of human sociality: the need for, and the good provided by, authority. In enabling us to do more complex activities, to gain and communicate understanding of the world around us and to flourish in political communities, authority ultimately leads us to enjoy God. Victor Lee Austin makes a unique contribution to political theology by deliberating the ways that authority functions both socially and epistemologically. The field of ecclesiology is also enriched by the book's discussion of authority as at once necessary and fallible. Those interested in the work of Michael Polanyi, Yves Simon, or Oliver O'Donovan will find these authors brought into the broader conversation about authority in an engaging way.

Operations Research: An Introduction McGraw-Hill Science/Engineering/Math

The fundamental mathematical tools needed to understand machine learning include linear algebra, analytic geometry, matrix decompositions, vector calculus, optimization, probability and statistics. These topics are traditionally taught in disparate courses, making it hard for data science or computer science students, or professionals, to efficiently learn the mathematics. This self-contained textbook bridges the gap between mathematical and machine learning texts, introducing the mathematical concepts with a minimum of prerequisites. It uses these concepts to derive four central machine learning methods: linear regression, principal component analysis, Gaussian mixture models and support vector machines. For students and others with a mathematical background, these derivations provide a starting point to machine learning texts. For those learning the mathematics for the first time, the methods help build intuition and practical experience with applying mathematical concepts. Every chapter includes worked examples and exercises to test understanding. Programming tutorials are offered on the book's web site.
