*Physics of Light and Optics*

(Black & White) Courier Corporation

The updated third edition of the only textbook on colour The revised third edition of *Colour and the Optical Properties of Materials* focuses on the ways that colour is produced, both in the natural world and in a wide range of applications. The expert author offers an introduction to the science underlying colour and optics and explores many of the most recent applications. The text is divided into three main sections: behaviour of light in homogeneous media, which can

largely be explained by classical wave optics; the way in which light interacts with atoms or molecules, which must be explained mainly in terms of photons; and the interaction of light with insulators, semiconductors and metals, in which the band structure notions are of primary concern. The updated third edition retains the proven concepts outlined in the previous editions and contains information on the significant developments in the field with many figures redrawn and new material added. The text contains new or extended sections on photonic crystals,

---

holograms, flat lenses, super-resolution optical microscopy and modern display technologies. This important book: Offers an introduction to the science that underlies the everyday concept of colour. Reviews the cross-disciplinary subjects of physics, chemistry, biology and materials science, to link light, colour and perception. Includes information on many modern applications, such as the numerous different colour displays now available, optical amplifiers, lasers, super-resolution optical microscopy and lighting including LEDs and OLEDs. Contains new sections on photonic crystals, holograms, flat lenses, super-resolution optical microscopy and display technologies. Presents many worked examples, with problems and exercises at the end of each chapter. Written for students in materials science, physics, chemistry and the biological sciences, the third edition of *Colour and The Optical Properties of Materials* covers the basic science of the topic and has been thoroughly updated to include recent advances in the field.

A Unified Summary of the Models and Optimization Methods Used in Computational Lithography Optical lithography is one of the most challenging areas of current integrated circuit manufacturing technology. The semiconductor industry is relying more on resolution enhancement techniques (RETs), since their implementation does not require significant changes in fabrication infrastructure. Computational Lithography is the first book to address the computational optimization of RETs in optical lithography, providing an in-depth discussion of optimal optical proximity correction (OPC), phase shifting mask (PSM), and off-axis illumination (OAI) RET tools that use model-based mathematical optimization approaches. The book starts with an introduction to optical lithography systems, electric magnetic

---

field principles, and the fundamentals of optimization from a mathematical point of view. It goes on to describe in detail different types of optimization algorithms to implement RETs. Most of the algorithms developed are based on the application of the OPC, PSM, and OAI approaches and their combinations. Algorithms for coherent illumination as well as partially coherent illumination systems are described, and numerous simulations are offered to illustrate the effectiveness of the algorithms. In addition, mathematical derivations of all optimization frameworks are presented. The accompanying MATLAB® software files for all the RET methods described in the book make it easy for readers to run and investigate the codes in order to understand and apply the optimization algorithms, as well as to design a set of optimal lithography masks. The codes may also be used by

readers for their research and development activities in their academic or industrial organizations. An accompanying MATLAB® software guide is also included. An accompanying MATLAB® software guide is included, and readers can download the software to use with the guide at [ftp://ftp.wiley.com/public/sci\\_tech\\_med/computational\\_lithography](ftp://ftp.wiley.com/public/sci_tech_med/computational_lithography). Tailored for both entry-level and experienced readers, Computational Lithography is meant for faculty, graduate students, and researchers, as well as scientists and engineers in industrial organizations whose research or career field is semiconductor IC fabrication, optical lithography, and RETs. Computational lithography draws from the rich theory of inverse problems, optics, optimization, and computational imaging; as such, the book is also directed to researchers and practitioners in these fields.

'Fresh, attractive, humorous and witty, Tiya is easy to read because it wears its learning lightly.' -Upamanyu Chatterjee The perky parrot Tiya's secure world is shattered when

---

he hears an unknown voice urging him to leave his home, the old banyan tree. As he launches into an adventure-filled journey through strange lands, meeting fantastic creatures along the way, Tiya comes to terms with his strengths and weaknesses. He discovers that no one in this universe is ordinary, and that life is a series of experiences that ultimately unshackle you from your own narrow existence. It is up to you to take on this adventure and come out of it as a free spirit. This delightful fable is irreverent and inspiring at the same time. Written by a monk with several years of learning and experience as a teacher, it is an imaginative rendering of Vedantic and Yoga philosophy. Yet you will find no sermons-only the story of a simple parrot and his formless mentor Hans.

While several available texts discuss molded plastic optics, none provide information on all classes of molded optics. Filling this gap, Molded Optics: Design and Manufacture presents detailed descriptions of molded plastic, glass, and infrared optics. Since an understanding of the manufacturing process is necessary to develop cost-effective, producible designs, the book extensively covers various manufacturing methods, design guidelines, trade-offs, best practices, and testing of critical parameters. It also discusses topics that often arise when designing systems with molded optics, such as mitigating stray light and mating systems by

---

eye. The first three chapters of the book focus on subjects important to the design of systems using molded optics: optical design, visual optics, and stray light. Following these background chapters, the text provides in-depth information on the design and manufacture of molded plastic optics, molded glass optics, and molded infrared optics. The final chapter on testing emphasizes the special characteristics of molded optics. Experts in their particular areas, the authors draw on their considerable knowledge and real-world experiences to give a thorough account of the design and manufacture of molded plastic, glass, and infrared optics. The book will help readers improve their ability to develop systems that employ molded optics.
