Applied Naval Architecture is intended for undergraduate students of many of the disciplines in maritime affairs, including marine engineering, marine transportation, nautical science, shipbuilding or ship production (shipyard apprentice schools), marine electrical engineering, meteorology, and oceanography. It could be used as an introduction to naval architecture for technical personnel of all types already employed in shipyards, and for licensed officers as a general reference and as preparation for license upgrading examinations. In short, its purpose is to describe what a naval architect does, and how he or she does it, to all students and practitioners involved in the business of merchant ships and shipping, except for professional naval architects themselves. Students preparing for a degree in naval architecture would also find the book useful as an introduction to their profession.

This textbook has two main objectives. Firstly, it outlines the problems associated with the management and conservation of marine living resources, with particular attention given to the twin concepts of economic value and sustainability. It demonstrates the contribution that economics can make to understanding these problems as well as helping to frame policies to mitigate them. Secondly, it looks in detail at the key methods that may be used to collect and analyse socio-economic data, oriented towards the information needs of decision makers and stakeholders involved in fisheries management. Together, these two objectives address the question: how does society make the best use of its marine living resources?

This project is aimed at those with no prior knowledge: None at all. Aiming for 'simple is best' and the KISS principle ('keep it simple stupid') means that everything in this book is 'simplified for clarity'. The diagrams will not be over-dense blueprints and, wherever I make a grand sweeping statement, I will completely omit to mention any exceptions to the rule. I'll do my best not to use big words, abbreviations, or use any numbers. To keep us on track, I've put 'look up watchwords' at the end of each part. These are intended to be entered into your favorite internet search engine. By providing these sign posts, those who want more information can go off and get it, whilst the rest of us carry on regardless. With my excuses made, I hope you get as much out this informal introduction to marine engineering as I got from writing it. My only real promise is any revenue made from this tome shall be used exclusively for foolish, unwise and meaningless adventures.

Pounder's Marine Diesel Engines and Gas Turbines, Tenth Edition, gives engineering cadets, marine engineers, ship operators and managers insights into currently available engines and auxiliary equipment and trends for the future. This new edition introduces new engine models that will be most commonly installed in ships over the next decade, as well as the latest legislation and pollutant emissions procedures. Since publication of the last edition in 2009, a number of emission control areas (ECAs) have been established by the International Maritime Organization (IMO) in which exhaust emissions are subject to even more stringent controls. In addition, there are now rules that affect new ships and their emission of CO<sub>2</sub> measured as a product of cargo carried. Provides the latest emission control technologies, such as SCR and water

scrubbers Contains complete updates of legislation and pollutant emission procedures Includes the latest emission control technologies and expands upon remote monitoring and control of engines

**Introduction to Naval Architecture** A&C Black

The U.S. shipbuilding industry now confronts grave challenges in providing essential support of national objectives. With recent emphasis on renewal of the U.S. naval fleet, followed by the defense build-down, U.S.

shipbuilders have fallen far behind in commercial ship construction, and face powerful new competition from abroad. This book examines ways to reestablish the U.S. industry, to provide a technology base and R&D infrastructure sustaining both commercial and military goals. Comparing U.S. and foreign shipbuilders in four technological areas, the authors find that U.S. builders lag most severely in business process technologies, and in technologies of new products and materials. New advances in system technologies, such as simulation, are also needed, as are continuing developments in shipyard production technologies. The report identifies roles that various government agencies, academia, and, especially, industry itself must play for the U.S. shipbuilding industry to attempt a turnaround.
