Introduction to Sol-Gel Processing - Alain C. Pierre ... This process can be summarized in six steps: (1) the formation of a stable metal precursor solution referred to as “ sol ” ; (2) the formation of a “ gel ” through a polycondensation reaction; (3) the aging of the gel for hours or days, resulting in the expulsion of the solvent, i.e., Ostwald ripening, and the formation of a solid mass; (4) the drying of the gel of any liquids; (5) dehydration and surface stabilization; and (6) heat treatment of the gels at high temperatures to generate ... In materials science, the sol – gel process is a method for producing solid materials from small molecules. The method is used for the fabrication of metal oxides, especially the oxides of silicon and titanium. The process involves conversion of monomers into a colloidal solution that acts as the precursor for an integrated network of either discrete particles or network polymers. Typical precursors are metal alkoxides.
